**OBJECTIVE:**

To provide the required mathematical support in real life problems and develop probabilistic models which can be used in several areas of science and engineering.

**UNIT I RANDOM VARIABLES****9+3**

Discrete and continuous random variables – Moments – Moment generating functions – Binomial, Poisson, Geometric, Uniform, Exponential, Gamma and Normal distributions.

**UNIT II TWO - DIMENSIONAL RANDOM VARIABLES****9+3**

Joint distributions – Marginal and conditional distributions – Covariance – Correlation and Linear regression – Transformation of random variables.

**UNIT III RANDOM PROCESSES****9+3**

Classification – Stationary process – Markov process - Poisson process – Discrete parameter Markov chain – Chapman Kolmogorov equations – Limiting distributions

**UNIT IV QUEUEING MODELS****9+3**

Markovian queues – Birth and Death processes – Single and multiple server queueing models – Little's formula - Queues with finite waiting rooms – Queues with impatient customers: Balking and reneging.

**UNIT V ADVANCED QUEUEING MODELS****9+3**

Finite source models - M/G/1 queue – Pollaczek Khinchin formula - M/D/1 and M/E $\kappa$ /1 as special cases – Series queues – Open Jackson networks.

**TOTAL (L:45+T:15): 60 PERIODS OUTCOMES:**

1. The students will have a fundamental knowledge of the probability concepts.
2. Acquire skills in analyzing queueing models.
3. It also helps to understand and characterize phenomenon which evolve with respect to time in a probabilistic manner.

**UNIT - I****RANDOM VARIABLES****Introduction**

Consider an experiment of throwing a coin twice. The outcomes {HH, HT, TH, TT} consider the sample space. Each of these outcome can be associated with a number by specifying a rule of association with a number by specifying a rule of association (eg. The number of heads). Such a rule of association is called a random variable. We denote a random variable by the capital letter (X, Y, etc) and any particular value of the random variable by x and y.

Thus a random variable X can be considered as a function that maps all elements in the sample space S into points on the real line. The notation  $X(S)=x$  means that x is the value associated with the outcomes S by the Random variable X.

**1.1 SAMPLE SPACE**

Consider an experiment of throwing a coin twice. The outcomes  $S = \{HH, HT, TH, TT\}$  constitute the sample space.

**1.2 RANDOM VARIABLE**

In this sample space each of these outcomes can be associated with a number by specifying a rule of association. Such a rule of association is called a random variables.

Eg : Number of heads

We denote random variable by the letter (X, Y, etc) and any particular value of the random variable by x or y.

$$S = \{HH, HT, TH, TT\}$$

$$X(S) = \{2, 1, 1, 0\}$$

Thus a random X can be the considered as a fun. That maps all elements in the sample space S into points on the real line. The notation  $X(S) = x$  means that x is the value associated with outcome s by the R.V.X.

**Example 1.1**

In the experiment of throwing a coin twice the sample space S is  $S = \{HH, HT, TH, TT\}$ . Let X be a random variable chosen such that  $X(S) = x$  (the number of heads).

**Note**

Any random variable whose only possible values are 0 and 1 is called a Bernoulli random variable.

**1.1.1 DISCRETE RANDOM VARIABLE**

**Definition :** A discrete random variable is a R.V.X whose possible values constitute finite set of values or countably infinite set of values.

**Example 1.1**

All the R.V.'s from Example : 1 are discrete R.V.'s

**Remark**

The meaning of  $P(X \leq a)$ .

$P(X \leq a)$  is simply the probability of the set of outcomes 'S' in the sample space for which  $X(s) \leq a$ .

$$\text{Or } P(X \leq a) = P\{S : X(S) \leq a\}$$

In the above example : 1 we should write

$$P(X \leq 1) = P(\text{HH, HT, TH}) = \frac{3}{4}$$

Here  $P(X \leq 1) = \frac{3}{4}$  means the probability of the R.V.X (the number of heads) is less than or equal to 1 is  $\frac{3}{4}$ .

**Distribution function of the random variable X or cumulative distribution of the random variable X****Def :**

The distribution function of a random variable X defined in  $(-\infty, \infty)$  is given by

$$F(x) = P(X \leq x) = P\{s : X(s) \leq x\}$$

**Note**

Let the random variable X takes values  $x_1, x_2, \dots, x_n$  with probabilities  $P_1, P_2, \dots, P_n$  and let  $x_1 < x_2 < \dots < x_n$

Then we have

$$F(x) = P(X < x_1) = 0, -\infty < x < x_1,$$

$$F(x) = P(X < x_1) = 0, P(X < x_1) + P(X = x_1) = 0 + p_1 = p_1$$

$$F(x) = P(X < x_2) = 0, P(X < x_1) + P(X = x_1) + P(X = x_2) = p_1 + p_2$$

$$F(x) = P(X < x_n) = P(X < x_1) + P(X = x_1) + \dots + P(X = x_n)$$

$$= p_1 + p_2 + \dots + p_n = 1$$

**1.1.2 PROPERTIES OF DISTRIBUTION FUNCTIONS**

Property : 1  $P(a < X \leq b) = F(b) - F(a)$ , where  $F(x) = P(X \leq x)$

Property : 2  $P(a \leq X \leq b) = P(X = a) + F(b) - F(a)$

Property : 3  $P(a < X < b) = P(a < X \leq b) - P(X = b)$

$$= F(b) - F(a) - P(X = b) \quad \text{by prob (1)}$$

**1.1.3 PROBABILITY MASS FUNCTION (OR) PROBABILITY FUNCTION**

Let  $X$  be a one dimensional discrete R.V. which takes the values  $x_1, x_2, \dots$ . To each possible outcome ' $x_i$ ' we can associate a number  $p_i$ .

i.e.,  $P(X = x_i) = P(x_i) = p_i$  called the probability of  $x_i$ . The number  $p_i = P(x_i)$  satisfies the following conditions.

- (i)  $p(x_i) \geq 0, \forall_i$
- (ii)  $\sum_{i=1}^{\infty} p(x_i) = 1$

The function  $p(x)$  satisfying the above two conditions is called the probability mass function (or) probability distribution of the R.V.X. The probability distribution  $\{x_i, p_i\}$  can be displayed in the form of table as shown below.

$X = x_i$	$x_1$	$x_2$	.....	$x_i$
$P(X = x_i) = p_i$	$p_1$	$p_2$	.....	$p_i$

**Notation**

Let 'S' be a sample space. The set of all outcomes 'S' in S such that  $X(S) = x$  is denoted by writing  $X = x$ .

$$P(X = x) = P\{S : X(s) = x\}$$

$$P(x \leq a) = P\{S : X(s) \in (-\infty, a)\}$$

$$\text{and } P(a < x \leq b) = P\{s : X(s) \in (a, b)\}$$

$$P(X = a \text{ or } X = b) = P\{(X = a) \cup (X = b)\}$$

$$P(X = a \text{ and } X = b) = P\{(X = a) \cap (X = b)\} \quad \text{and so on.}$$

**Theorem 1** If  $X_1$  and  $X_2$  are random variable and  $K$  is a constant then  $KX_1$ ,  $X_1 + X_2$ ,  $X_1X_2$ ,  $K_1X_1 + K_2X_2$ ,  $X_1 - X_2$  are also random variables.

**Theorem 2**

If ‘ $X$ ’ is a random variable and  $f(\bullet)$  is a continuous function, then  $f(X)$  is a random variable.

**Note**

If  $F(x)$  is the distribution function of one dimensional random variable then

- I.  $0 \leq F(x) \leq 1$
- II. If  $x < y$ , then  $F(x) \leq F(y)$
- III.  $F(-\infty) = \lim_{x \rightarrow -\infty} F(x) = 0$
- IV.  $F(\infty) = \lim_{x \rightarrow \infty} F(x) = 1$
- V. If ‘ $X$ ’ is a discrete R.V. taking values  $x_1, x_2, x_3$

Where  $x_1 < x_2 < x_{i-1} < x_i \dots$  then

$$P(X = x_i) = F(x_i) - F(x_{i-1})$$

**Example 1.2**

A random variable  $X$  has the following probability function

Values of X	0	1	2	3	4	5	6	7	8
Probability P(X)	a	3a	5a	7a	9a	11a	13a	15a	17a

- (i) Determine the value of ‘a’
- (ii) Find  $P(X < 3)$ ,  $P(X \geq 3)$ ,  $P(0 < X < 5)$
- (iii) Find the distribution function of  $X$ .

**Solution**

Values of X	0	1	2	3	4	5	6	7	8
p(x)	a	3a	5a	7a	9a	11a	13a	15a	17a

(i) We know that if  $p(x)$  is the probability of mass function then

$$\sum_{i=0}^8 p(x_i) = 1$$

$$p(0) + p(1) + p(2) + p(3) + p(4) + p(5) + p(6) + p(7) + p(8) = 1$$

$$a + 3a + 5a + 7a + 9a + 11a + 13a + 15a + 17a = 1$$

$$81a = 1$$

$$a = 1/81$$

put  $a = 1/81$  in table 1, e get table 2

**Table 2**

X = x	0	1	2	3	4	5	6	7	8
P(x)	1/81	3/81	5/81	7/81	9/81	11/81	13/81	15/81	17/81

(ii)  $P(X < 3) = p(0) + p(1) + p(2)$

$$= 1/81 + 3/81 + 5/81 = 9/81$$

(ii)  $P(X \geq 3) = 1 - p(X < 3)$

$$= 1 - 9/81 = 72/81$$

(iii)  $P(0 < x < 5) = p(1) + p(2) + p(3) + p(4)$  here 0 & 5 are not include

$$= 3/81 + 5/81 + 7/81 + 9/81$$

$$= \frac{3 + 5 + 7 + 8 + 9}{81} = \frac{24}{81}$$

(iv) To find the distribution function of X using table 2, we get

X = x	F(X) = P(x ≤ x)
0	F(0) = p(0) = 1/81
1	F(1) = P(X ≤ 1) = p(0) + p(1) = 1/81 + 3/81 = 4/81
2	F(2) = P(X ≤ 2) = p(0) + p(1) + p(2) = 4/81 + 5/81 = 9/81
3	F(3) = P(X ≤ 3) = p(0) + p(1) + p(2) + p(3) = 9/81 + 7/81 = 16/81
4	F(4) = P(X ≤ 4) = p(0) + p(1) + ..... + p(4) = 16/81 + 9/81 = 25/81
5	F(5) = P(X ≤ 5) = p(0) + p(1) + ..... + p(4) + p(5) = 25/81 + 11/81 = 36/81
6	F(6) = P(X ≤ 6) = p(0) + p(1) + ..... + p(6) = 36/81 + 13/81 = 49/81
7	F(7) = P(X ≤ 7) = p(0) + p(1) + ..... + p(6) + p(7) = 49/81 + 15/81 = 64/81

8	$F(8) = P(X \leq 8) = p(0) + p(1) + \dots + p(6) + p(7) + p(8)$ $= 64/81 + 17/81 = 81/81 = 1$
---	---

## 1.2 CONTINUOUS RANDOM VARIABLE

**Def :** A R.V. 'X' which takes all possible values in a given interval is called a continuous random variable.

**Example :** Age, height, weight are continuous R.V.'s.

### 1.2.1 PROBABILITY DENSITY FUNCTION

Consider a continuous R.V. 'X' specified on a certain interval (a, b) (which can also be a infinite interval  $(-\infty, \infty)$ ).

If there is a function  $y = f(x)$  such that

$$\lim_{\Delta x \rightarrow 0} \frac{P(x < X < x + \Delta x)}{\Delta x} = f(x)$$

Then this function  $f(x)$  is termed as the probability density function (or) simply density function of the R.V. 'X'.

It is also called the frequency function, distribution density or the probability density function.

The curve  $y = f(x)$  is called the probability curve of the distribution curve.

**Remark :**

If  $f(x)$  is p.d.f of the R.V.X then the probability that a value of the R.V. X will fall in some interval (a, b) is equal to the definite integral of the function  $f(x)$  a to b.

$$P(a < x < b) = \int_a^b f(x) dx \quad (\text{or})$$

$$P(a \leq X \leq b) = \int_a^b f(x) dx$$

### 1.2.3 PROPERTIES OF P.D.F

The p.d.f  $f(x)$  of a R.V.X has the following properties

$$(i) f(x) \geq 0, -\infty < x < \infty \quad (ii) \int_{-\infty}^{\infty} f(x) dx = 1$$

**Remark**

1. In the case of discrete R.V. the probability at a point say at  $x = c$  is not zero. But in the case of a continuous R.V.X the probability at a point is always zero.

$$P(X = c) = \int_{-\infty}^{\infty} f(x) dx = [x]_c^c = C - C = 0$$

2. If  $x$  is a continuous R.V. then we have  $p(a \leq X \leq b) = p(a \leq X < b)$   
 $= p(a < X \leq b)$

## IMPORTANT DEFINITIONS INTERMS OF P.D.F

If  $f(x)$  is the p.d.f of a random variable 'X' which is defined in the interval (a, b) then

i	Arithmetic mean	$\int_a^b x f(x) dx$
i	Harmonic mean	$\int_a^b \frac{1}{x} f(x) dx$
ii	Geometric mean 'G' log G	$\int_a^b \log x f(x) dx$
v	Moments about origin	$\int_a^b x^r f(x) dx$
v	Moments about any point A	$\int_a^b (x - A)^r f(x) dx$
i	Moment about mean $\mu_r$	$\int_a^b (x - \text{mean})^r f(x) dx$
ii	Variance $\mu_2$	$\int_a^b (x - \text{mean})^2 f(x) dx$
iii	Mean deviation about the mean is M.D.	$\int_a^b  x - \text{mean}  f(x) dx$

### 1.2.4 Mathematical Expectations

**Def :** Let 'X' be a continuous random variable with probability density function  $f(x)$ .

Then the mathematical expectation of 'X' is denoted by  $E(X)$  and is given by

$$E(X) = \int_{-\infty}^{\infty} x f(x) dx$$

It is denoted by

$$\mu_r' = \int_{-\infty}^{\infty} x^r f(x) dx$$

Thus

$$\mu_1' = E(X) \quad (\mu_1' \text{ about origin})$$

$$\mu_2' = E(X^2) \quad (\mu_2' \text{ about origin})$$

$$\therefore \text{Mean} = \bar{X} = \mu_1' = E(X)$$

And

$$\text{Variance} = \mu_2' - \mu_1'^2$$

$$\text{Variance} = E(X^2) - [E(X)]^2$$

(a)

\*  $r^{\text{th}}$  moment (about mean)

Now

$$E\{X - E(X)\}^r = \int_{-\infty}^{\infty} \{x - E(X)\}^r f(x) dx$$

$$= \int_{-\infty}^{\infty} \{x - \bar{X}\}^r f(x) dx$$

Thus

$$\mu_r = \int_{-\infty}^{\infty} \{x - \bar{X}\}^r f(x) dx \quad (b)$$

Where  $\mu_r = E[X - E(X)]^r$

This gives the  $r^{\text{th}}$  moment about mean and it is denoted by  $\mu_r$

Put  $r = 1$  in (B) we get

$$\mu_1 = \int_{-\infty}^{\infty} \{x - \bar{X}\} f(x) dx$$

$$= \int_{-\infty}^{\infty} x f(x) dx - \int_{-\infty}^{\infty} \bar{X} f(x) dx$$

$$= \bar{X} - \bar{X} \int_{-\infty}^{\infty} f(x) dx \quad \left[ \because \int_{-\infty}^{\infty} f(x) dx = 1 \right]$$

$$= \bar{X} - \bar{X}$$

$$\mu_1 = 0$$

Put  $r = 2$  in (B), we get

$$\mu_2 = \int_{-\infty}^{\infty} (x - \bar{X})^2 f(x) dx$$

$$\text{Variance} = \mu_2 = E[X - E(X)]^2$$

Which gives the variance in terms of expectations.

**Note:**

Let  $g(x) = K$  (Constant), then

$$E[g(X)] = E(K) = \int_{-\infty}^{\infty} K f(x) dx$$

$$= K \int_{-\infty}^{\infty} f(x) dx \quad \left[ \because \int_{-\infty}^{\infty} f(x) dx = 1 \right]$$

$$= K \cdot 1 = K$$

Thus  $E(K) = K \Rightarrow E[\text{a constant}] = \text{constant}$ .

### 1.2.4 EXPECTATIONS (Discrete R.V.'s)

Let 'X' be a discrete random variable with P.M.F  $p(x)$

Then

$$E(X) = \sum_x x p(x)$$

For discrete random variables 'X'

$$E(X^r) = \sum_x x^r p(x) \quad (\text{by def})$$

If we denote

$$E(X^r) = \mu_r'$$

Then

$$\mu_r' = E[X^r] = \sum_x x^r p(x)$$

Put  $r = 1$ , we get

$$\text{Mean } \mu_1' = \sum_x x p(x)$$

Put  $r = 2$ , we get

$$\mu_2' = E[X^2] = \sum_x x^2 p(x)$$

$$\therefore \mu_2 = \mu_2' - \mu_1'^2 = E(X^2) - \{E(X)\}^2$$

The  $r^{\text{th}}$  moment about mean

$$\begin{aligned} \mu_r' &= E[\{X - E(X)\}^r] \\ &= \sum_x (x - \bar{X})^r p(x), \quad E(X) = \bar{X} \end{aligned}$$

Put  $r = 2$ , we get

$$\text{Variance} = \mu_2 = \sum_x (x - \bar{X})^2 p(x)$$

### ADDITION THEOREM (EXPECTATION)

#### Theorem :1

If  $X$  and  $Y$  are two continuous random variable with pdf  $f_x(x)$  and  $f_y(y)$  then  
 $E(X+Y) = E(X) + E(Y)$

### \* MULTIPLICATION THEOREM OF EXPECTATION

#### Theorem :2

If  $X$  and  $Y$  are independent random variables,  
 Then  $E(XY) = E(X) \cdot E(Y)$

#### Note :

If  $X_1, X_2, \dots, X_n$  are 'n' independent random variables, then  
 $E[X_1, X_2, \dots, X_n] = E(X_1), E(X_2), \dots, E(X_n)$

#### Theorem : 3

If 'X' is a random variable with pdf  $f(x)$  and 'a' is a constant, then

$$(i) \quad E[a G(x)] = a E[G(x)]$$

$$(ii) \quad E[G(x)+a] = E[G(x)+a]$$

Where  $G(X)$  is a function of 'X' which is also a random variable.

#### Theorem :4

If 'X' is a random variable with p.d.f.  $f(x)$  and 'a' and 'b' are constants, then

$$E[ax + b] = a E(X) + b$$

**Cor 1:**

If we take  $a = 1$  and  $b = -E(X) = -\bar{X}$ , then we get

$$E(X - \bar{X}) = E(X) - E(X) = 0$$

**Note**

$$E\left(\frac{1}{X}\right) \neq \frac{1}{E(X)}$$

$$E[\log(x)] \neq \log E(X)$$

$$E(X^2) \neq [E(X)]^2$$

**1.2.4 EXPECTATION OF A LINEAR COMBINATION OF RANDOM VARIABLES**

Let  $X_1, X_2, \dots, X_n$  be any 'n' random variable and if  $a_1, a_2, \dots, a_n$  are constants, then

$$E[a_1X_1 + a_2X_2 + \dots + a_nX_n] = a_1E(X_1) + a_2E(X_2) + \dots + a_nE(X_n)$$

**Result**

If  $X$  is a random variable, then

$$\text{Var}(aX + b) = a^2\text{Var}(X) \text{ 'a' and 'b' are constants.}$$

**Covariance :**

If  $X$  and  $Y$  are random variables, then covariance between them is defined as

$$\begin{aligned} \text{Cov}(X, Y) &= E\{[X - E(X)][Y - E(Y)]\} \\ &= E\{XY - XE(Y) - E(X)Y + E(X)E(Y)\} \\ \text{Cov}(X, Y) &= E(XY) - E(X) \cdot E(Y) \quad (A) \end{aligned}$$

If  $X$  and  $Y$  are independent, then

$$E(XY) = E(X) E(Y)$$

Sub (B) in (A), we get

$$\text{Cov}(X, Y) = 0$$

∴ If  $X$  and  $Y$  are independent, then

$$\text{Cov}(X, Y) = 0$$

**Note**

- (i)  $\text{Cov}(aX, bY) = ab \text{Cov}(X, Y)$
- (ii)  $\text{Cov}(X+a, Y+b) = \text{Cov}(X, Y)$
- (iii)  $\text{Cov}(aX+b, cY+d) = ac \text{Cov}(X, Y)$
- (iv)  $\text{Var}(X_1 + X_2) = \text{Var}(X_1) + \text{Var}(X_2) + 2 \text{Cov}(X_1, X_2)$

If  $X_1, X_2$  are independent

$$\text{Var}(X_1 \pm X_2) = \text{Var}(X_1) + \text{Var}(X_2)$$

**EXPECTATION TABLE**

Discrete R.V's	Continuous R.V's
1. $E(X) = \sum x p(x)$	1. $E(X) = \int_{-\infty}^{\infty} x f(x) dx$
2. $E(X^r) = \mu_r' = \sum_x x^r p(x)$	2. $E(X^r) = \mu_r' = \int_{-\infty}^{\infty} x^r f(x) dx$

3. Mean = $\mu'_r = \sum x p(x)$	3. Mean = $\mu'_r = \int_{-\infty}^{\infty} x f(x) dx$
4. $\mu'_2 = \sum x^2 p(x)$	4. $\mu'_2 = \int_{-\infty}^{\infty} x^2 f(x) dx$
5. Variance = $\mu'_2 - \mu_1'^2 = E(X^2) - \{E(X)\}^2$	5. Variance = $\mu'_2 - \mu_1'^2 = E(X^2) - \{E(X)\}^2$

### SOLVED PROBLEMS ON DISCRETE R.V'S

#### Example :1

When die is thrown, 'X' denotes the number that turns up. Find  $E(X)$ ,  $E(X^2)$  and  $\text{Var}(X)$ .

#### Solution

Let 'X' be the R.V. denoting the number that turns up in a die.

'X' takes values 1, 2, 3, 4, 5, 6 and with probability 1/6 for each

X = x	1	2	3	4	5	6
p(x)	1/6	1/6	1/6	1/6	1/6	1/6
	$p(x_1)$	$p(x_2)$	$p(x_3)$	$p(x_4)$	$p(x_5)$	$p(x_6)$

Now

$$\begin{aligned}
 E(X) &= \sum_{i=1}^6 x_i p(x_i) \\
 &= x_1 p(x_1) + x_2 p(x_2) + x_3 p(x_3) + x_4 p(x_4) + x_5 p(x_5) + x_6 p(x_6) \\
 &= 1 \times (1/6) + 2 \times (1/6) + 3 \times (1/6) + 4 \times (1/6) + 5 \times (1/6) + 6 \times (1/6) \\
 &= 21/6 = 7/2 \quad (1)
 \end{aligned}$$

$$\begin{aligned}
 E(X^2) &= \sum_{i=1}^6 x_i^2 p(x_i) \\
 &= x_1^2 p(x_1) + x_2^2 p(x_2) + x_3^2 p(x_3) + x_4^2 p(x_4) + x_5^2 p(x_5) + x_6^2 p(x_6) \\
 &= 1(1/6) + 4(1/6) + 9(1/6) + 16(1/6) + 25(1/6) + 36(1/6) \\
 &= \frac{1+4+9+16+25+36}{6} = \frac{91}{6} \quad (2)
 \end{aligned}$$

$$\begin{aligned}
 \text{Variance}(X) &= \text{Var}(X) = E(X^2) - [E(X)]^2 \\
 &= \frac{91}{6} - \left(\frac{7}{2}\right)^2 = \frac{91}{6} - \frac{49}{4} = \frac{35}{12}
 \end{aligned}$$

#### Example :2

Find the value of (i) C (ii) mean of the following distribution given

$$f(x) = \begin{cases} C(x - x^2), & 0 < x < 1 \\ 0 & \text{otherwise} \end{cases}$$

**Solution**

$$\text{Given } f(x) = \begin{cases} C(x - x^2), & 0 < x < 1 \\ 0 & \text{otherwise} \end{cases} \quad (1)$$

$$\int_{-\infty}^{\infty} f(x) dx = 1$$

$$\int_0^1 C(x - x^2) dx = 1 \quad [\text{using (1)}] \quad [ \because 0 < x < 1 ]$$

$$C \left[ \frac{x^2}{2} - \frac{x^3}{3} \right]_0^1 = 1$$

$$C \left[ \frac{1}{2} - \frac{1}{3} \right] = 1$$

$$C \left[ \frac{3-2}{6} \right] = 1$$

$$\frac{C}{6} = 1 \quad C = 6 \quad (2)$$

$$\text{Sub (2) in (1), } f(x) = 6(x - x^2), \quad 0 < x < 1 \quad (3)$$

$$\text{Mean} = E(x) = \int_{-\infty}^{\infty} x f(x) dx$$

$$= \int_0^1 x \cdot 6(x - x^2) dx \quad [\text{from (3)}] \quad [ \because 0 < x < 1 ]$$

$$= \int_0^1 (6x^2 - x^3) dx$$

$$= \left[ \frac{6x^3}{3} - \frac{6x^4}{4} \right]_0^1$$

$$\therefore \text{Mean} = \frac{1}{2}$$

Mean	C
$\frac{1}{2}$	6

### 1.3 CONTINUOUS DISTRIBUTION FUNCTION

Def :

If  $f(x)$  is a p.d.f. of a continuous random variable 'X', then the function

$$F_X(x) = F(x) = P(X \leq x) = \int_{-\infty}^{\infty} f(x) dx, \quad -\infty < x < \infty$$

is called the distribution function or cumulative distribution function of the random variable.

### 1.3.1 PROPERTIES OF CDF OF A R.V. 'X'

- (i)  $0 \leq F(x) \leq 1, -\infty < x < \infty$   
 (ii)  $\lim_{x \rightarrow -\infty} F(x) = 0, \quad \lim_{x \rightarrow \infty} F(x) = 1$   
 (iii)  $P(a \leq X \leq b) = \int_a^b f(x) dx = F(b) - F(a)$   
 (iv)  $F'(x) = \frac{dF(x)}{dx} = f(x) \geq 0$   
 (v)  $P(X = x_i) = F(x_i) - F(x_i - 1)$

#### Example :1.3.1

Given the p.d.f. of a continuous random variable 'X' follows

$$f(x) = \begin{cases} 6x(1-x), & 0 < x < 1 \\ 0 & \text{otherwise} \end{cases}, \text{ find c.d.f. for 'X'}$$

#### Solution

$$\text{Given } f(x) = \begin{cases} 6x(1-x), & 0 < x < 1 \\ 0 & \text{otherwise} \end{cases}$$

The c.d.f is  $F(x) = \int_{-\infty}^x f(x) dx, -\infty < x < \infty$

(i) When  $x < 0$ , then

$$\begin{aligned} F(x) &= \int_{-\infty}^x f(x) dx \\ &= \int_{-\infty}^x 0 dx = 0 \end{aligned}$$

(ii) When  $0 < x < 1$ , then

$$\begin{aligned} F(x) &= \int_{-\infty}^x f(x) dx \\ &= \int_{-\infty}^0 f(x) dx + \int_0^x f(x) dx \\ &= 0 + \int_0^x 6x(1-x) dx = 6 \int_0^x x(1-x) dx = 6 \left[ \frac{x^2}{2} - \frac{x^3}{3} \right]_0^x \\ &= 3x^2 - 2x^3 \end{aligned}$$

(iii) When  $x > 1$ , then

$$\begin{aligned} F(x) &= \int_{-\infty}^x f(x) dx \\ &= \int_{-\infty}^0 0 dx + \int_0^1 6x(1-x) dx + \int_1^x 0 dx \\ &= 6 \int_0^1 (x - x^2) dx = 1 \end{aligned}$$

Using (1), (2) & (3) we get

$$F(x) = \begin{cases} 0, & x < 0 \\ 3x^2 - 2x^3, & 0 < x < 1 \\ 1, & x > 1 \end{cases}$$

**Example :1.3.2**

(i) If  $f(x) = \begin{cases} e^{-x}, & x \geq 0 \\ 0, & x < 0 \end{cases}$  defined as follows a density function ?

(ii) If so determine the probability that the variate having this density will fall in the interval (1, 2).

**Solution**

Given  $f(x) = \begin{cases} e^{-x}, & x \geq 0 \\ 0, & x < 0 \end{cases}$

(a) In  $(0, \infty)$ ,  $e^{-x}$  is +ve  
 $\therefore f(x) \geq 0$  in  $(0, \infty)$

$$\begin{aligned} \text{(b)} \quad \int_{-\infty}^{\infty} f(x) dx &= \int_{-\infty}^0 f(x) dx + \int_0^{\infty} f(x) dx \\ &= \int_{-\infty}^0 0 dx + \int_0^{\infty} e^{-x} dx \\ &= \left[ -e^{-x} \right]_0^{\infty} = -e^{-\infty} + 1 \\ &= 1 \end{aligned}$$

Hence  $f(x)$  is a p.d.f

(ii) We know that

$$\begin{aligned} P(a \leq X \leq b) &= \int_a^b f(x) dx \\ P(1 \leq X \leq 2) &= \int_1^2 f(x) dx = \int_1^2 e^{-x} dx = \left[ -e^{-x} \right]_{+1}^2 \\ &= \int_1^2 e^{-x} dx = \left[ -e^{-x} \right]_{+1}^2 \\ &= -e^{-2} + e^{-1} = -0.135 + 0.368 = 0.233 \end{aligned}$$

**Example :1.3.3**

A probability curve  $y = f(x)$  has a range from 0 to  $\infty$ . If  $f(x) = e^{-x}$ , find the mean and variance and the third moment about mean.

**Solution**

$$\text{Mean} = \int_0^{\infty} x f(x) dx$$

$$= \int_0^{\infty} x e^{-x} dx = \left[ x[-e^{-x}] - [e^{-x}] \right]_0^{\infty}$$

$$\text{Mean} = 1$$

$$\text{Variance } \mu_2 = \int_0^{\infty} (x - \text{Mean})^2 f(x) dx$$

$$= \int_0^{\infty} (x - 1)^2 e^{-x} dx$$

$$\mu_2 = 1$$

Third moment about mean

$$\mu_3 = \int_a^b (x - \text{Mean})^3 f(x) dx$$

Here  $a = 0$ ,  $b = \infty$

$$\mu_3 = \int_a^b (x - 1)^3 e^{-x} dx$$

$$= \left\{ (x - 1)^3 (-e^{-x}) - 3(x - 1)^2 (e^{-x}) + 6(x - 1)(-e^{-x}) - 6(e^{-x}) \right\}_0^{\infty}$$

$$= -1 + 3 - 6 + 6 = 2$$

$$\mu_3 = 2$$

#### 1.4 MOMENT GENERATING FUNCTION

**Def:** The moment generating function (MGF) of a random variable 'X' (about origin) whose probability function  $f(x)$  is given by

$$M_X(t) = E[e^{tX}]$$

$$= \begin{cases} \int_{x=-\infty}^{\infty} e^{tx} f(x) dx, & \text{for a continuous probably function} \\ \sum_{x=-\infty}^{\infty} e^{tx} p(x), & \text{for a discrete probably function} \end{cases}$$

Where  $t$  is real parameter and the integration or summation being extended to the entire range of  $x$ .

##### Example: 1.4.1

Prove that the  $r^{\text{th}}$  moment of the R.V. 'X' about origin is  $M_X(t) = \int_0^{\infty} \frac{t^r}{r!} \mu_r'$

##### Proof

$$\text{WKT } M_X(t) = E(e^{tX})$$

$$= E \left[ 1 + \frac{tX}{1!} + \frac{(tX)^2}{2!} + \frac{(tX)^3}{3!} + \dots + \frac{(tX)^r}{r!} + \dots \right]$$

$$= E[1] + tE(X) + \frac{t^2}{2!}E(X^2) + \dots + \frac{t^r}{r!}E(X^r) + \dots$$

$$M_X(t) = 1 + t\mu_1' + \frac{t^2}{2!}\mu_2' + \frac{t^3}{3!}\mu_3' + \dots + \frac{t^r}{r!}\mu_r' + \dots$$

[using  $\mu_r' = E(X^r)$ ]

Thus  $r^{\text{th}}$  moment = coefficient of  $\frac{t^r}{r!}$

**Note**

1. The above results gives MGF interms of moments.
2. Since  $M_X(t)$  generates moments, it is known as moment generating function.

**Example :1.4.2**

Find  $\mu_1'$  and  $\mu_2'$  from  $M_X(t)$

**Proof**

$$\text{WKT } M_X(t) = \sum_{r=0}^{\infty} \frac{t^r}{r!} \mu_r'$$

$$M_X(t) = \mu_0' + \frac{t}{1!} \mu_1' + \frac{t^2}{2!} \mu_2' + \dots + \frac{t^r}{r!} \mu_r' \quad (\text{A})$$

Differentiating (A) W.R.T 't', we get

$$M_X'(t) = \mu_1' + \frac{2t}{2!} \mu_2' + \frac{t^3}{3!} \mu_3' + \dots \quad (\text{B})$$

Put  $t = 0$  in (B), we get

$$M_X'(0) = \mu_1' = \text{Mean}$$

$$\text{Mean} = M_1'(0) \quad (\text{or}) \quad \left[ \frac{d}{dt}(M_X(t)) \right]_{t=0}$$

$$M_X''(t) = \mu_2' + t \mu_3' + \dots$$

Put  $t = 0$  in (B)

$$M_X''(0) = \mu_2' \quad (\text{or}) \quad \left[ \frac{d^2}{dt^2}(M_X(t)) \right]_{t=0}$$

$$\text{In general } \mu_r' = \left[ \frac{d^r}{dt^r}(M_X(t)) \right]_{t=0}$$

**Example :1.4.3**

Obtain the MGF of X about the point  $X = a$ .

**Proof**

The moment generating function of X about the point  $X = a$  is

$$M_X(t) = E[e^{t(X-a)}]$$

$$= E \left[ 1 + t(X-a) + \frac{t^2}{2!}(X-a)^2 + \dots + \frac{t^r}{r!}(X-a)^r + \dots \right]$$

$$\left[ \begin{array}{l} \text{Formula} \\ e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \dots \end{array} \right]$$

$$= E(1) + E[t(X-a)] + E\left[\frac{t^2}{2!}(X-a)^2\right] + \dots + E\left[\frac{t^r}{r!}(X-a)^r\right] + \dots$$

$$\begin{aligned}
 &= 1 + t E(X - a) + \frac{t^2}{2!} E(X - a)^2 + \dots + \frac{t^r}{r!} E(X - a)^r + \dots \\
 &= 1 + t \mu'_1 + \frac{t^2}{2!} \mu'_2 + \dots + \frac{t^r}{r!} \mu'_r + \dots \quad \text{Where } \mu'_r = E[(X - a)^r] \\
 [M_X(t)]_{x=a} &= 1 + t \mu'_1 + \frac{t^2}{2!} \mu'_2 + \dots + \frac{t^r}{r!} \mu'_r + \dots
 \end{aligned}$$

**Result**

$$M_{CX}(t) = E[e^{tx}] \tag{1}$$

$$M_X(t) = E[e^{ctx}] \tag{2}$$

From (1) & (2) we get

$$M_{CX}(t) = M_X(ct)$$

**Example :1.4.4**

If  $X_1, X_2, \dots, X_n$  are independent variables, then prove that

$$\begin{aligned}
 M_{X_1+X_2+\dots+X_n}(t) &= E[e^{t(X_1+X_2+\dots+X_n)}] \\
 &= E[e^{tX_1} \cdot e^{tX_2} \dots e^{tX_n}] \\
 &= E(e^{tX_1}) \cdot E(e^{tX_2}) \dots E(e^{tX_n}) \\
 [\because X_1, X_2, \dots, X_n \text{ are independent}] \\
 &= M_{X_1}(t) \cdot M_{X_2}(t) \dots M_{X_n}(t)
 \end{aligned}$$

**Example :1.4.5**

Prove that if  $U = \frac{X - a}{h}$ , then  $M_U(t) = e^{-\frac{at}{h}} \cdot M_X\left(\frac{t}{h}\right)$ , where a, h are constants.

**Proof**

By definition

$$\begin{aligned}
 M_U(t) &= E[e^{tu}] && \because [M_X(t) = E[e^{tx}]] \\
 &= E\left[e^{t\left(\frac{X-a}{h}\right)}\right] \\
 &= E\left[e^{\frac{tX}{h} - \frac{ta}{h}}\right] \\
 &= E\left[e^{\frac{tX}{h}}\right] E\left[e^{-\frac{ta}{h}}\right] \\
 &= e^{-\frac{ta}{h}} E\left[e^{\frac{tX}{h}}\right] \quad \text{[by def]} \\
 &= e^{-\frac{ta}{h}} \cdot M_X\left(\frac{t}{h}\right)
 \end{aligned}$$

$\therefore M_U(t) = e^{-\frac{at}{h}} \cdot M_X\left(\frac{t}{h}\right)$ , where  $U = \frac{X - a}{h}$  and  $M_X(t)$  is the MGF about origin.

**Problems****Example: 1.4.6**

Find the MGF for the distribution where

$$f(x) = \begin{cases} \frac{2}{3} & \text{at } x = 1 \\ \frac{1}{3} & \text{at } x = 2 \\ 0 & \text{otherwise} \end{cases}$$

**Solution**

Given  $f(1) = \frac{2}{3}$

$$f(2) = \frac{1}{3}$$

$$f(3) = f(4) = \dots = 0$$

MGF of a R.V. 'X' is given by

$$M_X(t) = E[e^{tx}]$$

$$= \sum_{x=0}^{\infty} e^{tx} f(x)$$

$$= e^0 f(0) + e^t f(1) + e^{2t} f(2) + \dots$$

$$= 0 + e^t f(2/3) + e^{2t} f(1/3) + 0$$

$$= 2/3e^t + 1/3e^{2t}$$

$$\therefore \text{MGF is } M_X(t) = \frac{e^t}{3}[2 + e^t]$$

**1.5 Discrete Distributions**

The important discrete distribution of a random variable 'X' are

1. Binomial Distribution
2. Poisson Distribution
3. Geometric Distribution

**1.5.1 BINOMIAL DISTRIBUTION**

**Def :** A random variable X is said to follow binomial distribution if its probability law is given by

$$P(x) = p(X = x \text{ successes}) = nC_x p^x q^{n-x}$$

Where  $x = 0, 1, 2, \dots, n, p+q = 1$

**Note**

Assumptions in Binomial distribution

- i) There are only two possible outcomes for each trail (success or failure).
- ii) The probability of a success is the same for each trail.
- iii) There are 'n' trails, where 'n' is a constant.
- iv) The 'n' trails are independent.

**Example: 1.5.1**

Find the Moment Generating Function (MGF) of a binomial distribution about origin.

**Solution**

$$\text{WKT} \quad M_X(t) = \sum_{x=0}^n e^{tx} p(x)$$

Let 'X' be a random variable which follows binomial distribution then MGF about origin is given by

$$\begin{aligned} E[e^{tx}] &= M_X(t) = \sum_{x=0}^n e^{tx} p(x) \\ &= \sum_{x=0}^n e^{tx} nC_x p^x q^{n-x} \quad \left[ \because p(x) = nC_x p^x q^{n-x} \right] \\ &= \sum_{x=0}^n (e^{tx}) p^x nC_x q^{n-x} \\ &= \sum_{x=0}^n (pe^t)^x nC_x q^{n-x} \\ \therefore M_X(t) &= (q + pe^t)^n \end{aligned}$$

**Example :1.5. 2**

Find the mean and variance of binomial distribution.

**Solution**

$$\begin{aligned} M_X(t) &= (q + pe^t)^n \\ \therefore M'_X(t) &= n(q + pe^t)^{n-1} \cdot pe^t \end{aligned}$$

Put  $t = 0$ , we get

$$M'_X(0) = n(q + p)^{n-1} \cdot p$$

$$\text{Mean} = E(X) = np \quad \left[ \because (q + p) = 1 \right] \quad \left[ \text{Mean } M'_X(0) \right]$$

$$M''_X(t) = np \left[ (q + pe^t)^{n-1} \cdot e^t + e^t (n-1)(q + pe^t)^{n-2} \cdot pe^t \right]$$

Put  $t = 0$ , we get

$$M''_X(t) = np \left[ (q + p)^{n-1} + (n-1)(q + p)^{n-2} \cdot p \right]$$

$$= np \left[ 1 + (n-1)p \right]$$

$$= np + n^2 p^2 - np^2$$

$$= n^2 p^2 + np(1-p)$$

$$M''_X(0) = n^2 p^2 + npq \quad \left[ \because 1-p = q \right]$$

$$M''_X(0) = E(X^2) = n^2 p^2 + npq$$

$$\text{Var}(X) = E(X^2) - [E(X)]^2 = n^2 p^2 + npq - n^2 p^2 = npq$$

$$\text{Var}(X) = npq$$

$$\text{S.D} = \sqrt{npq}$$

**Example :1.5.3**

Find the Moment Generating Function (MGF) of a binomial distribution about mean (np).

**Solution**

Wkt the MGF of a random variable X about any point 'a' is

$$\begin{aligned} M_X(t) \text{ (about } X = a) &= E[e^{t(X-a)}] \\ \text{Here 'a' is mean of the binomial distribution} \\ M_X(t) \text{ (about } X = np) &= E[e^{t(X-np)}] \\ &= E[e^{tX} \cdot e^{-tnp}] \\ &= e^{-tnp} \cdot [E[e^{tX}]] \\ &= e^{-tnp} \cdot (q+pe^t)^n \\ &= (e^{-tp})^n \cdot (q+pe^t)^n \\ \therefore \text{ MGF about mean} &= (e^{-tp})^n \cdot (q+pe^t)^n \end{aligned}$$

#### Example :1.5.4

Additive property of binomial distribution.

#### Solution

The sum of two binomial variates is not a binomial variate.

Let X and Y be two independent binomial variates with parameter  $(n_1, p_1)$  and  $(n_2, p_2)$  respectively.

Then

$$\begin{aligned} M_X(t) &= (q_1 + p_1 e^t)^{n_1}, & M_Y(t) &= (q_2 + p_2 e^t)^{n_2} \\ \therefore M_{X+Y}(t) &= M_X(t) \cdot M_Y(t) \quad [\because X \& Y \text{ are independent R.V.'s}] \\ &= (q_1 + p_1 e^t)^{n_1} \cdot (q_2 + p_2 e^t)^{n_2} \end{aligned}$$

RHS cannot be expressed in the form  $(q + pe^t)^n$ . Hence by uniqueness theorem of MGF X+Y is not a binomial variate. Hence in general, the sum of two binomial variates is not a binomial variate.

#### Example :1.5.5

If  $M_X(t) = (q+pe^t)^{n_1}$ ,  $M_Y(t) = (q+pe^t)^{n_2}$ , then

$$M_{X+Y}(t) = (q+pe^t)^{n_1+n_2}$$

#### Problems on Binomial Distribution

1. Check whether the following data follow a binomial distribution or not. Mean = 3; variance = 4.

#### Solution

$$\text{Given Mean } np = 3 \quad (1)$$

$$\text{Variance } npq = 4 \quad (2)$$

$$\frac{(2)}{(1)} \Rightarrow \frac{np}{npq} = \frac{3}{4}$$

$$\Rightarrow q = \frac{4}{3} = 1\frac{1}{3} \text{ which is } > 1.$$

Since  $q > 1$  which is not possible ( $0 < q < 1$ ). The given data not follow binomial distribution.

**Example :1.5.6**

The mean and SD of a binomial distribution are 5 and 2, determine the distribution.

**Solution**

$$\text{Given Mean} = np = 5 \quad (1)$$

$$\text{SD} = \sqrt{npq} = 2 \quad (2)$$

$$\frac{(2)}{(1)} \Rightarrow \frac{np}{npq} = \frac{4}{5} \Rightarrow q = \frac{4}{5}$$

$$\therefore p = 1 - \frac{4}{5} = \frac{1}{5} \Rightarrow p = \frac{1}{5}$$

Sub (3) in (1) we get

$$n \times \frac{1}{5} = 5$$

$$n = 25$$

$\therefore$  The binomial distribution is

$$\begin{aligned} P(X = x) &= p(x) = {}^n C_x p^x q^{n-x} \\ &= 25 C_x (1/5)^x (4/5)^{25-x}, \quad x = 0, 1, 2, \dots, 25 \end{aligned}$$

**1.6 Poisson Distribution****Def :**

A random variable X is said to follow if its probability law is given by

$$P(X = x) = p(x) = \frac{e^{-\lambda} \lambda^x}{x!}, \quad x = 0, 1, 2, \dots, \infty$$

Poisson distribution is a limiting case of binomial distribution under the following conditions or assumptions.

1. The number of trials 'n' should be infinitely large i.e.  $n \rightarrow \infty$ .
2. The probability of successes 'p' for each trial is infinitely small.
3.  $np = \lambda$ , should be finite where  $\lambda$  is a constant.

**\* To find MGF**

$$M_X(t) = E(e^{tx})$$

$$= \sum_{x=0}^{\infty} e^{tx} p(x)$$

$$= \sum_{x=0}^{\infty} e^{tx} \left( \frac{\lambda^x e^{-\lambda}}{x!} \right)$$

$$= \sum_{x=0}^{\infty} \frac{e^{-\lambda} (\lambda e^t)^x}{x!}$$

$$= e^{-\lambda} \sum_{x=0}^{\infty} \frac{(\lambda e^t)^x}{x!}$$

$$= e^{-\lambda} \left[ 1 + \lambda e^t + \frac{(\lambda e^t)^2}{2!} + \dots \right]$$

$$= e^{-\lambda} e^{\lambda e^t} = e^{\lambda(e^t - 1)}$$

Hence  $M_X(t) = e^{\lambda(e^t-1)}$

\* To find Mean and Variance

WKT  $M_X(t) = e^{\lambda(e^t-1)}$

$$\therefore M_X'(t) = e^{\lambda(e^t-1)} \cdot e^t$$

$$M_X'(0) = e^{-\lambda} \cdot \lambda$$

$$\begin{aligned} \mu_1' = E(X) &= \sum_{x=0}^{\infty} x \cdot p(x) \\ &= \sum_{x=0}^{\infty} x \cdot \frac{e^{-\lambda} \lambda^x}{x!} = \sum_{x=0}^{\infty} \frac{x \cdot e^{-\lambda} \lambda \lambda^{x-1}}{x!} \end{aligned}$$

$$= 0 + e^{-\lambda} \cdot \lambda \sum_{x=1}^{\infty} \frac{x \cdot \lambda^{x-1}}{x!}$$

$$= \lambda e^{-\lambda} \cdot \sum_{x=1}^{\infty} \frac{\lambda^{x-1}}{(x-1)!}$$

$$= \lambda e^{-\lambda} \left[ 1 + \lambda + \frac{\lambda^2}{2!} + \dots \right]$$

$$= \lambda e^{-\lambda} \cdot e^{\lambda}$$

Mean =  $\lambda$

$$\mu_2' = E[X^2] = \sum_{x=0}^{\infty} x^2 \cdot p(x) = \sum_{x=0}^{\infty} x^2 \cdot \frac{e^{-\lambda} \lambda^x}{x!}$$

$$= \sum_{x=0}^{\infty} \{x(x-1) + x\} \cdot \frac{e^{-\lambda} \lambda^x}{x!}$$

$$= \sum_{x=0}^{\infty} \frac{x(x-1)e^{-\lambda} \lambda^x}{x!} + \sum_{x=0}^{\infty} \frac{x \cdot e^{-\lambda} \lambda^x}{x!}$$

$$= e^{-\lambda} \lambda^2 \sum_{x=0}^{\infty} \frac{\lambda^{x-2}}{(x-2)(x-3) \dots 1} + \lambda$$

$$= e^{-\lambda} \lambda^2 \sum_{x=0}^{\infty} \frac{\lambda^{x-2}}{(x-2)!} + \lambda$$

$$= e^{-\lambda} \lambda^2 \left[ 1 + \frac{\lambda}{1!} + \frac{\lambda^2}{2!} + \dots \right] + \lambda$$

$$= \lambda^2 + \lambda$$

$$\text{Variance } \mu_2 = E(X^2) - [E(X)]^2 = \lambda^2 + \lambda - \lambda^2 = \lambda$$

Variance =  $\lambda$

Hence Mean = Variance =  $\lambda$

Note : \* sum of independent Poisson Variates is also Poisson variate.

**1.6.1 PROBLEMS ON POISSON DISTRIBUTION****Example:1.6.2**

If  $x$  is a Poisson variate such that  $P(X=1) = \frac{3}{10}$  and  $P(X=2) = \frac{1}{5}$ , find the  $P(X=0)$  and  $P(X=3)$ .

**Solution**

$$P(X = x) = \frac{e^{-\lambda} \lambda^x}{x!}$$

$$\therefore P(X=1) = e^{-\lambda} \lambda = \frac{3}{10} \quad (\text{Given})$$

$$= \lambda e^{-\lambda} = \frac{3}{10} \quad (1)$$

$$P(X=2) = \frac{e^{-\lambda} \lambda^2}{2!} = \frac{1}{5} \quad (\text{Given})$$

$$\frac{e^{-\lambda} \lambda^2}{2!} = \frac{1}{5} \quad (2)$$

$$(1) \Rightarrow e^{-\lambda} \lambda = \frac{3}{10} \quad (3)$$

$$(2) \Rightarrow e^{-\lambda} \lambda^2 = \frac{1}{5} \quad (4)$$

$$\frac{(3)}{(4)} \Rightarrow \frac{1}{\lambda} = \frac{3}{4}$$

$$\lambda = \frac{4}{3}$$

$$\therefore P(X=0) = \frac{e^{-\lambda} \lambda^0}{0!} = e^{-4/3}$$

$$P(X=3) = \frac{e^{-\lambda} \lambda^3}{3!} = \frac{e^{-4/3} (4/3)^3}{3!}$$

**Example :1.6.3**

If  $X$  is a Poisson variable

$$P(X = 2) = 9 P(X = 4) + 90 P(X=6)$$

Find (i) Mean if  $X$  (ii) Variance of  $X$

**Solution**

$$P(X=x) = \frac{e^{-\lambda} \lambda^x}{x!}, \quad x = 0, 1, 2, \dots$$

$$\text{Given } P(X = 2) = 9 P(X = 4) + 90 P(X=6)$$

$$\frac{e^{-\lambda} \lambda^2}{2!} = 9 \frac{e^{-\lambda} \lambda^4}{4!} + 90 \frac{e^{-\lambda} \lambda^6}{6!}$$

$$\frac{1}{2} = \frac{9\lambda^2}{4!} + \frac{90\lambda^4}{6!}$$

$$\frac{1}{2} = \frac{3\lambda^2}{8} + \frac{\lambda^4}{8}$$

$$1 = \frac{3\lambda^2}{4} + \frac{\lambda^4}{4}$$

$$\lambda^4 + 3\lambda^2 - 4 = 0$$

$$\lambda^2 = 1 \quad \text{or} \quad \lambda^2 = -4$$

$$\lambda = \pm 1 \quad \text{or} \quad \lambda = \pm 2i$$

$$\therefore \text{Mean} = \lambda = 1, \text{ Variance} = \lambda = 1$$

$$\therefore \text{Standard Deviation} = 1$$

**Example :1.6.4 Derive probability mass function of Poisson distribution as a limiting case of Binomial distribution**

**Solution**

We know that the Binomial distribution is

$$P(X=x) = {}^n C_x p^x q^{n-x}$$

$$= \frac{n!}{(n-x)! x!} p^x (1-p)^{n-x}$$

$$= \frac{1.2.3 \dots (n-x)(n-x+1) \dots np^n (1-p)^n}{1.2.3 \dots (n-x) x! (1-p)^x}$$

$$= \frac{1.2.3 \dots (n-x)(n-x+1) \dots n \left(\frac{p}{1-p}\right)^x (1-p)^n}{1.2.3 \dots (n-x) x!}$$

$$= \frac{n(n-1)(n-2) \dots (n-x+1)}{x!} \frac{\lambda^x}{n^x} \frac{1}{\left(1-\frac{\lambda}{n}\right)^x} \left(1-\frac{\lambda}{n}\right)^n$$

$$= \frac{n(n-1)(n-2) \dots (n-x+1)}{x!} x \left(1-\frac{\lambda}{n}\right)^n \left(1-\frac{\lambda}{n}\right)^{-x}$$

$$P(X=x) = \frac{1 \left(1-\frac{1}{n}\right) \left(1-\frac{2}{n}\right) \dots \left\{1-\frac{(x-1)}{n}\right\}}{x!} \lambda^x \left(1-\frac{\lambda}{n}\right)^{n-x}$$

$$= \frac{\lambda^x}{x!} 1 \left(1-\frac{1}{n}\right) \left(1-\frac{2}{n}\right) \dots \left\{1-\frac{(x-1)}{n}\right\} \left(1-\frac{\lambda}{n}\right)^{n-x}$$

When  $n \rightarrow \infty$

$$P(X=x) = \frac{\lambda^x}{x!} \lim_{n \rightarrow \infty} \left[ 1 - \left(1-\frac{1}{n}\right) \left(1-\frac{2}{n}\right) \dots \left\{1-\frac{(x-1)}{n}\right\} \left(1-\frac{\lambda}{n}\right)^{n-x} \right]$$

$$= \frac{\lambda^x}{x!} \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n}\right) \lim_{n \rightarrow \infty} \left(1 - \frac{2}{n}\right) \dots \lim_{n \rightarrow \infty} \left(1 - \frac{x-1}{n}\right)$$

We know that

$$\lim_{n \rightarrow \infty} \left(1 - \frac{\lambda}{n}\right)^{n-x} = e^{-\lambda}$$

$$\text{and } \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n}\right) = \lim_{n \rightarrow \infty} \left(1 - \frac{2}{n}\right) \dots = \lim_{n \rightarrow \infty} \left(1 - \left(\frac{x-1}{n}\right)\right) = 1$$

$$\therefore P(X=x) = \frac{\lambda^x}{x!} e^{-\lambda}, x = 0, 1, 2, \dots, \infty$$

### 1.7 GEOMETRIC DISTRIBUTION

**Def:** A discrete random variable 'X' is said to follow geometric distribution, if it assumes only non-negative values and its probability mass function is given by

$$P(X=x) = p(x) = q^{x-1}; x = 1, 2, \dots, 0 < p < 1, \quad \text{Where } q = 1-p$$

#### Example:1.7.1

To find MGF

$$M_X(t) = E[e^{tx}]$$

$$= \sum e^{tx} p(x)$$

$$= \sum_{x=1}^{\infty} e^{tx} q^{x-1} p$$

$$= \sum_{x=1}^{\infty} e^{tx} q^x q^{-1} p$$

$$= \sum_{x=1}^{\infty} e^{tx} q^x p / q$$

$$= p / q \sum_{x=1}^{\infty} e^{tx} q^x$$

$$= p / q \sum_{x=1}^{\infty} (e^t q)^x$$

$$= p / q \left[ (e^t q)^1 + (e^t q)^2 + (e^t q)^3 + \dots \right]$$

$$\text{Let } x = e^t q = p / q \left[ x + x^2 + x^3 + \dots \right]$$

$$= \frac{p}{q} x \left[ 1 + x + x^2 + \dots \right] = \frac{p}{q} (1-x)^{-1}$$

$$= \frac{p}{q} q e^t \left[ 1 - q e^t \right] = p e^t \left[ 1 - q e^t \right]^{-1}$$

$$\therefore M_X(t) = \frac{p e^t}{1 - q e^t}$$

**\* To find the Mean & Variance**

$$M'_X(t) = \frac{(1 - qe^t)pe^t - pe^t(-qe^t)}{(1 - qe^t)^2} = \frac{pe^t}{(1 - qe^t)^2}$$

$$\therefore E(X) = M'_X(0) = 1/p$$

$$\therefore \text{Mean} = 1/p$$

$$\text{Variance} \quad \mu''_X(t) = \frac{d}{dt} \left[ \frac{pe^t}{(1 - qe^t)^2} \right]$$

$$= \frac{(1 - qe^t)^2 pe^t - pe^t 2(1 - qe^t)(-qe^t)}{(1 - qe^t)^4}$$

$$= \frac{(1 - qe^t)^2 pe^t + 2pe^t qe^t (1 - qe^t)}{(1 - qe^t)^4}$$

$$M''_X(0) = \frac{1+q}{p^2}$$

$$\text{Var}(X) = E(X^2) - [E(X)]^2 = \frac{(1+q)}{p^2} - \frac{1}{p^2} \Rightarrow \frac{q}{p^2}$$

$$\text{Var}(X) = \frac{q}{p^2}$$

**Note**

Another form of geometric distribution

$$P[X=x] = q^x p; \quad x = 0, 1, 2, \dots$$

$$M_X(t) = \frac{p}{(1 - qe^t)}$$

$$\text{Mean} = q/p, \quad \text{Variance} = q/p^2$$

**Example 1.7.2**

If the MGF of X is  $(5 - 4e^t)^{-1}$ , find the distribution of X and  $P(X=5)$

**Solution**

Let the geometric distribution be

$$P(X = x) = q^x p, \quad x = 0, 1, 2, \dots$$

The MGF of geometric distribution is given by

$$\frac{p}{1 - qe^t} \quad (1)$$

$$\text{Here } M_X(t) = (5 - 4e^t)^{-1} \Rightarrow 5^{-1} \left[ 1 - \frac{4}{5} e^t \right]^{-1} \quad (2)$$

$$\text{Compare (1) & (2) we get } q = \frac{4}{5}; \quad p = \frac{1}{5}$$

$$\therefore P(X = x) = pq^x, \quad x = 0, 1, 2, 3, \dots$$

$$= \left( \frac{1}{5} \right) \left( \frac{4}{5} \right)^x$$

$$P(X = 5) = \left(\frac{1}{5}\right)\left(\frac{4}{5}\right)^5 = \frac{4^5}{5^6}$$

### 1.8 CONTINUOUS DISTRIBUTIONS

If 'X' is a continuous random variable then we have the following distribution

1. Uniform (Rectangular Distribution)
2. Exponential Distribution
3. Gamma Distribution
4. Normal Distribution

#### 1.8.1. Uniform Distribution (Rectangular Distribution)

**Def :** A random variable X is set to follow uniform distribution if its

$$f(x) = \begin{cases} \frac{1}{b-a}, & a < x < b \\ 0, & \text{otherwise} \end{cases}$$

\* To find MGF

$$\begin{aligned} M_X(t) &= \int_{-\infty}^{\infty} e^{tx} f(x) dx \\ &= \int_a^b e^{tx} \frac{1}{b-a} dx \\ &= \frac{1}{b-a} \left[ \frac{e^{tx}}{t} \right]_a^b \\ &= \frac{1}{(b-a)t} [e^{bx} - e^{at}] \end{aligned}$$

∴ The MGF of uniform distribution is

$$M_X(t) = \frac{e^{bt} - e^{at}}{(b-a)t}$$

\* To find Mean and Variance

$$\begin{aligned} E(X) &= \int_{-\infty}^{\infty} x f(x) dx \\ &= \int_a^b x \frac{1}{b-a} dx = \frac{1}{b-a} \int_a^b x dx = \frac{\left(\frac{x^2}{2}\right)_a^b}{b-a} \\ &= \frac{b^2 - a^2}{2(b-a)} = \frac{b+a}{2} = \frac{a+b}{2} \end{aligned}$$

$$\text{Mean } \mu_1' = \frac{a+b}{2}$$

Putting  $r = 2$  in (A), we get

$$\mu_2' = \int_a^b x^2 f(x) dx = \int_a^b \frac{x^2}{b-a} dx$$

$$= \frac{a^2 + ab + b^2}{3}$$

$$\therefore \text{Variance} = \mu_2' - \mu_1'^2$$

$$= \frac{b^2 + ab + b^2}{3} - \left(\frac{b+a}{2}\right)^2 = \frac{(b-a)^2}{12}$$

$$\text{Variance} = \frac{(b-a)^2}{12}$$

### PROBLEMS ON UNIFORM DISTRIBUTION

#### Example 1

If X is uniformly distributed over  $(-\alpha, \alpha)$ ,  $\alpha < 0$ , find  $\alpha$  so that

- (i)  $P(X > 1) = 1/3$   
(ii)  $P(|X| < 1) = P(|X| > 1)$

#### Solution

If X is uniformly distributed in  $(-\alpha, \alpha)$ , then its p.d.f. is

$$f(x) = \begin{cases} \frac{1}{2\alpha} & -\alpha < x < \alpha \\ 0 & \text{otherwise} \end{cases}$$

- (i)  $P(X > 1) = 1/3$

$$\int_1^{\alpha} f(x) dx = 1/3$$

$$\int_1^{\alpha} \frac{1}{2\alpha} dx = 1/3$$

$$\frac{1}{2\alpha} (x)_1^{\alpha} = 1/3 \quad \Rightarrow \frac{1}{2\alpha} (\alpha - 1) = 1/3$$

$$\alpha = 3$$

- (ii)  $P(|X| < 1) = P(|X| > 1) = 1 - P(|X| < 1)$

$$P(|X| < 1) + P(|X| < 1) = 1$$

$$2 P(|X| < 1) = 1$$

$$2 P(-1 < X < 1) = 1$$

$$2 \int_{-1}^1 f(x) dx = 1$$

$$2 \int_{-1}^1 \frac{1}{2\alpha} dx = 1$$

$$\Rightarrow \alpha = 2$$

#### Note

1. The distribution function F(x) is given by

$$F(x) = \begin{cases} 0 & -\alpha < x < \alpha \\ \frac{x-a}{b-a} & a \leq x \leq b \\ 1 & b < x < \infty \end{cases}$$

2. The p.d.f. of a uniform variate 'X' in (-a, a) is given by

$$F(x) = \begin{cases} \frac{1}{2a} & -a < x < a \\ 0 & \text{otherwise} \end{cases}$$

### 1.8.2 THE EXPONENTIAL DISTRIBUTION

**Def :** A continuous random variable 'X' is said to follow an exponential distribution with parameter  $\lambda > 0$  if its probability density function is given by

$$F(x) = \begin{cases} \lambda e^{-\lambda x} & x > a \\ 0 & \text{otherwise} \end{cases}$$

**To find MGF**

**Solution**

$$\begin{aligned} M_X(t) &= \int_{-\infty}^{\infty} e^{tx} f(x) dx \\ &= \int_0^{\infty} e^{tx} \lambda e^{-\lambda x} dx = \lambda \int_0^{\infty} e^{-(\lambda-t)x} dx \\ &= \lambda \left[ \frac{e^{-(\lambda-t)x}}{\lambda-t} \right]_0^{\infty} \\ &= \frac{\lambda}{-(\lambda-t)} [e^{-\infty} - e^{-0}] = \frac{\lambda}{\lambda-t} \\ \therefore \text{MGF of } x &= \frac{\lambda}{\lambda-t}, \lambda > t \end{aligned}$$

**\* To find Mean and Variance**

We know that MGF is

$$\begin{aligned} M_X(t) &= \frac{\lambda}{\lambda-t} = \frac{1}{1-\frac{t}{\lambda}} = \left(1 - \frac{t}{\lambda}\right)^{-1} \\ &= 1 + \frac{t}{\lambda} + \frac{t^2}{\lambda^2} + \dots + \frac{t^r}{\lambda^r} \\ &= 1 + \frac{t}{\lambda} + \frac{t^2}{2!} \left(\frac{2!}{\lambda^2}\right) + \dots + \frac{t^r}{r!} \left(\frac{r!}{\lambda^r}\right) \end{aligned}$$

$$M_X(t) = \sum_{r=0}^{\infty} \left( \frac{t}{\lambda} \right)^r$$

$$\therefore \text{Mean } \mu_1' = \text{Coefficient of } \frac{t^1}{1!} = \frac{1}{\lambda}$$

$$\mu_2' = \text{Coefficient of } \frac{t^2}{2!} = \frac{2}{\lambda^2}$$

$$\text{Variance} = \mu_2 = \mu_2' - \mu_1'^2 = \frac{2}{\lambda^2} - \frac{1}{\lambda^2} = \frac{1}{\lambda^2}$$

$$\text{Variance} = \frac{1}{\lambda^2} \quad \text{Mean} = \frac{1}{\lambda}$$

### Example 1

Let 'X' be a random variable with p.d.f

$$f(x) = \begin{cases} \frac{1}{3} e^{-\frac{x}{3}} & x > 0 \\ 0 & \text{otherwise} \end{cases}$$

Find 1)  $P(X > 3)$  2) MGF of 'X'

### Solution

WKT the exponential distribution is

$$f(x) = \lambda e^{-\lambda x}, \quad x > 0$$

$$\text{Here } \lambda = \frac{1}{3}$$

$$P(x > 3) = \int_3^{\infty} f(x) dx = \int_3^{\infty} \frac{1}{3} e^{-\frac{x}{3}} dx$$

$$P(X > 3) = e^{-1}$$

$$\text{MGF is } M_X(t) = \frac{\lambda}{\lambda - t}$$

$$= \frac{\frac{1}{3}}{\frac{1}{3} - t} = \frac{\frac{1}{3}}{\frac{1-3t}{3}} = \frac{1}{1-3t}$$

$$M_X(t) = \frac{1}{1-3t}$$

### Note

If X is exponentially distributed, then

$$P(X > s+t \mid X > s) = P(X > t), \text{ for any } s, t > 0.$$

## 1.8.3 GAMMA DISTRIBUTION

### Definition

A Continuous random variable X taking non-negative values is said to follow gamma distribution, if its probability density function is given by

$$f(x) = \frac{\lambda^\alpha x^{\alpha-1} e^{-\lambda x}}{\Gamma(\alpha)}, \alpha > 0, 0 < x < \infty$$

$$= 0, \text{ elsewhere}$$

and  $\int_0^\infty f(x) dx = 1$

$$= 0, \text{ elsewhere}$$

When  $\alpha$  is the parameter of the distribution.

**Additive property of Gamma Variates**

If  $X_1, X_2, X_3, \dots, X_k$  are independent gamma variates with parameters  $\lambda_1, \lambda_2, \dots, \lambda_k$  respectively then  $X_1 + X_2 + X_3 + \dots + X_k$  is also a gamma variate with parameter  $\lambda_1 + \lambda_2 + \dots + \lambda_k$ .

**Example :1**

Customer demand for milk in a certain locality, per month, is known to be a general Gamma R.V. If the average demand is a liters and the most likely demand b liters ( $b < a$ ), what is the variance of the demand?

Solution :

Let X be represent the monthly Customer demand for milk.

Average demand is the value of  $E(X)$ .

Most likely demand is the value of the mode of X or the value of X for which its density function is maximum.

If  $f(x)$  is the its density function of X, then

$$f(x) = \frac{\lambda^k x^{k-1} e^{-\lambda x}}{\Gamma(k)}, x > 0$$

$$f(x) = \frac{\lambda^k}{\Gamma(k)} [(k-1) x^{k-2} e^{-\lambda x} - \lambda x^{k-1} e^{-\lambda x}]$$

$$= 0, \text{ when } x=0, x= \frac{k-1}{\lambda}$$

$$f'(x) = \frac{\lambda^k}{\Gamma(k)} [(k-1) x^{k-2} e^{-\lambda x} - \lambda x^{k-1} e^{-\lambda x}]$$

$$< 0, \text{ when } x= \frac{k-1}{\lambda}$$

Therefore  $f(x)$  is maximum, when  $x= \frac{k-1}{\lambda}$

i.e, Most likely demand  $= \frac{k-1}{\lambda} = b \dots(1)$

and  $E(X) = \frac{k}{\lambda} \dots\dots\dots(2)$

Now  $V(X) = \frac{k}{\lambda^2} - \left(\frac{k-1}{\lambda}\right)^2 = \frac{k-1}{\lambda^2}$

$$= a(a-b) \quad \text{From (1) and (2)}$$

### TUTORIAL QUESTIONS

1. It is known that the probability of an item produced by a certain machine will be defective is 0.05. If the produced items are sent to the market in packets of 20, find the no. of packets containing at least, exactly and at most 2 defective items in a consignment of 1000 packets using (i) Binomial distribution (ii) Poisson approximation to binomial distribution.

2. The daily consumption of milk in excess of 20,000 gallons is approximately exponentially distributed with  $\lambda = 3000$ . The city has a daily stock of 35,000 gallons. What is the probability that of two days selected at random, the stock is insufficient for both days.

3. The density function of a random variable  $X$  is given by  $f(x) = Kx(2-x)$ ,  $0 \leq x \leq 2$ . Find  $K$ , mean, variance and  $r^{\text{th}}$  moment.

4. A binomial variable  $X$  satisfies the relation  $9P(X=4) = P(X=2)$  when  $n=6$ . Find the parameter  $p$  of the Binomial distribution.

5. Find the M.G.F for Poisson Distribution.

6. If  $X$  and  $Y$  are independent Poisson variates such that  $P(X=1) = P(X=2)$  and  $P(Y=2) = P(Y=3)$ . Find  $V(X-2Y)$ .

7. A discrete random variable has the following probability distribution

X:	0	1	2	3	4	5	6	7	8
P(X)	a	3a	5a	7a	9a	11a	13a	15a	17a

Find the value of  $a$ ,  $P(X < 3)$  and c.d.f of  $X$ .

7. In a component manufacturing industry, there is a small probability of  $1/500$  for any component to be defective. The components are supplied in packets of 10. Use Poisson distribution to calculate the approximate number of packets containing (1). No defective. (2). Two defective components in a consignment of 10,000 packets.

### WORKED OUT EXAMPLES

#### Example 1

Given the p.d.f. of a continuous random variable 'X' follows

$$f(x) = \begin{cases} 6x(1-x), & 0 < x < 1 \\ 0 & \text{otherwise} \end{cases}, \text{ find c.d.f. for 'X'}$$

#### Solution

$$\text{Given } f(x) = \begin{cases} 6x(1-x), & 0 < x < 1 \\ 0 & \text{otherwise} \end{cases}$$

$$\text{The c.d.f is } F(x) = \int_{-\infty}^x f(x) dx, \quad -\infty < x < \infty$$

(i) When  $x < 0$ , then

$$F(x) = \int_{-\infty}^x f(x) dx$$

$$= \int_{-\infty}^x 0 \, dx = 0$$

(ii) When  $0 < x < 1$ , then

$$F(x) = \int_{-\infty}^x f(x) \, dx$$

$$= \int_{-\infty}^0 f(x) \, dx + \int_0^x f(x) \, dx$$

$$= 0 + \int_0^x 6x(1-x) \, dx = 6 \int_0^x x(1-x) \, dx = 6 \left[ \frac{x^2}{2} - \frac{x^3}{3} \right]_0^x$$

$$= 3x^2 - 2x^3$$

(iii) When  $x > 1$ , then

$$F(x) = \int_{-\infty}^x f(x) \, dx$$

$$= \int_{-\infty}^0 0 \, dx + \int_0^1 6x(1-x) \, dx + \int_1^x 0 \, dx$$

$$= 6 \int_0^1 (x - x^2) \, dx = 1$$

Using (1), (2) & (3) we get

$$F(x) = \begin{cases} 0, & x < 0 \\ 3x^2 - 2x^3, & 0 < x < 1 \\ 1, & x > 1 \end{cases}$$

**Example :2**

A random variable X has the following probability function

Values of X									
Probability P(X)		a	a	a	a	1a	3a	5a	7a

- (i) Determine the value of 'a'
- (ii) Find  $P(X < 3)$ ,  $P(X \geq 3)$ ,  $P(0 < X < 5)$
- (iii) Find the distribution function of X.

**Solution**

Table 1

Values of X									
p(x)		a	a	a	a	1a	3a	5a	7a

(i) We know that if  $p(x)$  is the probability of mass function then

$$\sum_{i=0}^8 p(x_i) = 1$$

$$p(0) + p(1) + p(2) + p(3) + p(4) + p(5) + p(6) + p(7) + p(8) = 1$$

$$a + 3a + 5a + 7a + 9a + 11a + 13a + 15a + 17a = 1$$

$$81a = 1$$

$$a = 1/81$$

put  $a = 1/81$  in table 1, e get table 2

**Table 2**

X									
= x									
P									
(x)	/81	/81	/81	/81	/81	1/81	3/81	5/81	7/81

(ii)  $P(X < 3) = p(0) + p(1) + p(2)$

$$= 1/81 + 3/81 + 5/81 = 9/81$$

(ii)  $P(X \geq 3) = 1 - p(X < 3)$

$$= 1 - 9/81 = 72/81$$

(iii)  $P(0 < x < 5) = p(1) + p(2) + p(3) + p(4)$  here 0 & 5 are not include

$$= 3/81 + 5/81 + 7/81 + 9/81$$

$$3 + 5 + 7 + 8 + 9 = 24$$

$$= \frac{24}{81} = \frac{8}{27}$$

$$= \frac{8}{27}$$

(iv) To find the distribution function of X using table 2, we get

X	F(X) = P(x ≤ x)
0	F(0) = p(0) = 1/81
1	F(1) = P(X ≤ 1) = p(0) + p(1) = 1/81 + 3/81 = 4/81
2	F(2) = P(X ≤ 2) = p(0) + p(1) + p(2) = 4/81 + 5/81 = 9/81
3	F(3) = P(X ≤ 3) = p(0) + p(1) + p(2) + p(3) = 9/81 + 7/81 = 16/81
4	F(4) = P(X ≤ 4) = p(0) + p(1) + ..... + p(4) = 16/81 + 9/81 = 25/81
5	F(5) = P(X ≤ 5) = p(0) + p(1) + ..... + p(4) + p(5) = 25/81 + 11/81 = 36/81
6	F(6) = P(X ≤ 6) = p(0) + p(1) + ..... + p(6) = 36/81 + 13/81 = 49/81

7	$F(7) = P(X \leq 7) = p(0) + p(1) + \dots + p(6) + p(7)$ $= 49/81 + 15/81 = 64/81$
8	$F(8) = P(X \leq 8) = p(0) + p(1) + \dots + p(6) + p(7) + p(8)$ $= 64/81 + 17/81 = 81/81 = 1$

**Example :3**

The mean and SD of a binomial distribution are 5 and 2, determine the distribution.

**Solution**

Given Mean =  $np = 5$  (1)

SD =  $\sqrt{npq} = 2$  (2)

$$\frac{(2)}{(1)} \Rightarrow \frac{np}{npq} = \frac{4}{5} \Rightarrow q = \frac{4}{5}$$

$$\therefore p = 1 - \frac{4}{5} = \frac{1}{5} \Rightarrow p = \frac{1}{5}$$

Sub (3) in (1) we get

$$n \times 1/5 = 5$$

$$n = 25$$

$\therefore$  The binomial distribution is

$$P(X = x) = p(x) = {}^nC_x p^x q^{n-x}$$

$$= 25C_x (1/5)^x (4/5)^{25-x}, \quad x = 0, 1, 2, \dots, 25$$

**Example :4**

If X is a Poisson variable

$$P(X = 2) = 9 P(X = 4) + 90 P(X = 6)$$

Find (i) Mean if X (ii) Variance of X

**Solution**

$$P(X=x) = \frac{e^{-\lambda} \lambda^x}{x!}, \quad x = 0, 1, 2, \dots$$

Given  $P(X = 2) = 9 P(X = 4) + 90 P(X = 6)$

$$\frac{e^{-\lambda} \lambda^2}{2!} = 9 \frac{e^{-\lambda} \lambda^4}{4!} + 90 \frac{e^{-\lambda} \lambda^6}{6!}$$

$$\frac{1}{2} = \frac{9\lambda^2}{4!} + \frac{90\lambda^4}{6!}$$

$$\frac{1}{2} = \frac{3\lambda^2}{8} + \frac{\lambda^4}{8}$$

$$1 = \frac{3\lambda^2}{4} + \frac{\lambda^4}{4}$$

$$\lambda^4 + 3\lambda^2 - 4 = 0$$

$$\lambda^2 = 1 \quad \text{or} \quad \lambda^2 = -4$$

$$\lambda = \pm 1 \quad \text{or} \quad \lambda = \pm 2i$$

- ∴ Mean =  $\lambda = 1$ , Variance =  $\lambda = 1$
- ∴ Standard Deviation = 1

## UNIT – II

### TWO DIMENSIONAL RANDOM VARIABLES

#### Introduction

In the previous chapter we studied various aspects of the theory of a single R.V. In this chapter we extend our theory to include two R.V's one for each coordinator axis X and Y of the XY Plane.

**DEFINITION :** Let S be the sample space. Let  $X = X(S)$  &  $Y = Y(S)$  be two functions each assigning a real number to each outcome  $s \in S$ . hen  $(X, Y)$  is a two dimensional random variable.

### Types of random variables

1. Discrete R.V.'s
2. Continuous R.V.'s

#### 2.1 Discrete R.V.'s (Two Dimensional Discrete R.V.'s)

If the possible values of  $(X, Y)$  are finite, then  $(X, Y)$  is called a two dimensional discrete R.V. and it can be represented by  $(x_i, y)$ ,  $i = 1, 2, \dots, m$ .

In the study of two dimensional discrete R.V.'s we have the following 5 important terms.

- Joint Probability Function (JPF) (or) Joint Probability Mass Function.
- Joint Probability Distribution.
- Marginal Probability Function of X.
- Marginal Probability Function of Y.
- Conditional Probability Function.

##### 2.1.1 Joint Probability Function of discrete R.V.'s X and Y

The function  $P(X = x_i, Y = y_j) = P(x_i, y_j)$  is called the joint probability function for discrete random variable X and Y is denote by  $p_{ij}$ .

##### Note

1.  $P(X = x_i, Y = y_j) = P[(X = x_i) \cap (Y = y_j)] = p_{ij}$
2. It should satisfies the following conditions

$$(i) p_{ij} \geq \forall i, j \quad (ii) \sum_j \sum_i p_{ij} = 1$$

##### 2.1.2 Marginal Probability Function of X

If the joint probability distribution of two random variables X and Y is given then the marginal probability function of X is given by

$$P_x(x_i) = p_i \quad (\text{marginal probability function of Y})$$

**2.1.3 Conditional Probabilities**

The conditional probabilities function of X given Y = y<sub>j</sub> is given by

$$P[X = x_i / Y = y_j] = \frac{p_{ij}}{p_{.j}}$$

The set {x<sub>i</sub>, p<sub>ij</sub> / p<sub>.j</sub>}, i = 1, 2, 3, .....is called the conditional probability distribution of X given Y = y<sub>j</sub>.

The conditional probability function of Y given X = x<sub>i</sub> is given by

$$P[Y = y_i / X = x_j] = \frac{p_{ij}}{p_{i.}}$$

The set {y<sub>i</sub>, p<sub>ij</sub> / p<sub>i.</sub>}, j = 1, 2, 3, .....is called the conditional probability distribution of Y given X = x<sub>i</sub>.

**SOLVED PROBLEMS ON MARGINAL DISTRIBUTION**

**Example:2.1(a)**

From the following joint distribution of X and Y find the marginal distributions.

X \ Y	0	1	2
0	3/28	9/28	3/28
1	3/14	3/14	0
2	1/28	0	0

**Solution**

X \ Y	0	2	P <sub>Y</sub> (y) =
0	3/28	3/2	p(Y=y) = 15/28

	P(0,0)	8 P(2,0)	P <sub>y</sub> (0)
1	3/14 P(0, 1)	3/1 4 P(1,1)	6/14 = P <sub>y</sub> (1)
2	1/28 P(0,2)	0 P(2,2)	1/28 = P <sub>y</sub> (2)
P <sub>X</sub> (X) = P(X=x)	10/28 = 5/14 P <sub>X</sub> (0)	3/2 8 P <sub>X</sub> (2)	1

The marginal distribution of X

$$P_X(0) = P(X = 0) = p(0,0) + p(0,1) + p(0,2) = 5/14$$

$$P_X(1) = P(X = 1) = p(1,0) + p(1,1) + p(1,2) = 15/28$$

$$P_X(2) = P(X = 2) = p(2,0) + p(2,1) + p(2,2) = 3/28$$

Marginal probability function of X is

$$P_X(x) = \begin{cases} \frac{5}{14}, & x = 0 \\ \frac{15}{28}, & x = 1 \\ \frac{3}{28}, & x = 2 \end{cases}$$

The marginal distribution of Y

$$P_Y(0) = P(Y = 0) = p(0,0) + p(1,0) + p(2,0) = 15/28$$

$$P_Y(1) = P(Y = 1) = p(0,1) + p(2,1) + p(1,1) = 3/7$$

$$P_Y(2) = P(Y = 2) = p(0,2) + p(1,2) + p(2,2) = 1/28$$

Marginal probability function of Y is

$$P_Y(y) = \begin{cases} \frac{15}{28}, & y = 0 \\ \frac{3}{7}, & y = 1 \\ \frac{1}{28}, & y = 2 \end{cases}$$

## 2.2 CONTINUOUS RANDOM VARIABLES

- Two dimensional continuous R.V.'s

If  $(X, Y)$  can take all the values in a region  $R$  in the  $XY$  plans then  $(X, Y)$  is called two-dimensional continuous random variable.

- Joint probability density function :

$$(i) f_{XY}(x,y) \geq 0 ; (ii) \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f_{XY}(x,y) dy dx = 1$$

- Joint probability distribution function

$$F(x,y) = P[X \leq x, Y \leq y]$$

$$= \int_{-\infty}^x \left\{ \int_{-\infty}^y f(x,y) dx \right\} dy$$

- Marginal probability density function

$$f(x) = f_X(x) = \int_{-\infty}^{\infty} f_{x,y}(x,y) dy \text{ (Marginal pdf of X)}$$

$$f(y) = f_Y(y) = \int_{-\infty}^{\infty} f_{x,y}(x,y) dx \text{ (Marginal pdf of Y)}$$

- Conditional probability density function

$$(i) P(Y = y / X = x) = f(y / x) = \frac{f(x,y)}{f(x)}, f(x) > 0$$

$$(ii) P(X = x / Y = y) = f(x / y) = \frac{f(x,y)}{f(y)}, f(y) > 0$$

**Example :2.2.1**

Show that the function  $f(x, y) = \begin{cases} \frac{2}{5}(2x + 3y), & 0 < x < 1, & 0 < y < 1 \\ 0 & \text{otherwise} \end{cases}$

is a joint density function of X and Y.

**Solution**

We know that if  $f(x, y)$  satisfies the conditions

(i)  $f(x, y) \geq 0$       (ii)  $\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) dx dy = 1$ , then  $f(x, y)$  is a jdf

Given  $f(x, y) = \begin{cases} \frac{2}{5}(2x + 3y), & 0 < x < 1, & 0 < y < 1 \\ 0 & \text{otherwise} \end{cases}$

(i)  $f(x, y) \geq 0$  in the given interval  $0 \leq (x, y) \leq 1$

$$\begin{aligned} \text{(ii) } \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) dx dy &= \int_0^1 \int_0^1 \frac{2}{5}(2x + 3y) dx dy \\ &= \frac{2}{5} \int_0^1 \left[ 2 \frac{x^2}{2} + 3xy \right]_0^1 dy \\ &= \frac{2}{5} \int_0^1 (1 + 3y) dy = \frac{2}{5} \left[ y + \frac{3y^2}{2} \right]_0^1 = \frac{2}{5} \left( 1 + \frac{3}{2} \right) \\ &= \frac{2}{5} \left( \frac{5}{2} \right) = 1 \end{aligned}$$

Since  $f(x, y)$  satisfies the two conditions it is a j.d.f.

**Example: 2.2.2**

The j.d.f of the random variables X and Y is given

$$f(x, y) = \begin{cases} 8xy, & 0 < x < 1, & 0 < y < x \\ 0, & \text{otherwise} \end{cases}$$

Find (i)  $f_X(x)$       (ii)  $f_Y(y)$       (iii)  $f(y/x)$

**Solution**

We know that

(i) The marginal pdf of 'X' is

$$f_X(x) = f(x) = \int_{-\infty}^{\infty} f(x, y) dy = \int_0^x 8xy dy = 4x^3$$

$$f(x) = 4x^3, 0 < x < 1$$

(ii) The marginal pdf of 'Y' is

$$f_Y(y) = f(y) = \int_{-\infty}^{\infty} f(x, y) dy = \int_0^1 8xy dy = 4y$$

$$f(y) = 4y, 0 < y < \alpha$$

(iii) We know that

$$\begin{aligned} f(y/x) &= \frac{f(x, y)}{f(x)} \\ &= \frac{8xy}{4x^3} = \frac{2y}{x^2}, 0 < y < x, 0 < x < 1 \end{aligned}$$

### Result

Marginal pdf g	Marginal pdf y	F(y/x)
$4x^3, 0 < x < 1$	$4y, 0 < y < x$	$\frac{2y}{x^2}, 0 < y < x, 0 < x < 1$

## 2.3 REGRESSION

\* Line of regression

The line of regression of X on Y is given by

$$x - \bar{x} = r \cdot \frac{\sigma_y}{\sigma_x} (y - \bar{y})$$

The line of regression of Y on X is given by

$$y - \bar{y} = r \cdot \frac{\sigma_y}{\sigma_x} (x - \bar{x})$$

\* Angle between two lines of Regression.

$$\tan \theta = \frac{1 - r^2}{r} \left( \frac{\sigma_y \sigma_x}{\sigma_{x^2} + \sigma_{y^2}} \right)$$

\* Regression coefficient

Regression coefficients of Y on X

$$r \cdot \frac{\sigma_y}{\sigma_x} = b_{YX}$$

Regression coefficient of X and Y

$$r \cdot \frac{\sigma_x}{\sigma_y} = b_{XY}$$

$$\therefore \text{Correlation coefficient } r = \pm \sqrt{b_{XY} \times b_{YX}}$$

### Problems

1. From the following data, find

(i) The two regression equation

(ii) The coefficient of correlation between the marks in Economic and Statistics.

(iii) The most likely marks in statistics when marks in Economic are 30.

Marks in Economics	5	8	5	2	1	6	9	8	4	2
Marks in Statistics	0	6	9	1	6	2	1	0	3	9

**Solution**

		$X - \bar{X} = x$	$X - \bar{Y} = y$	$(X - \bar{X})^2$	$(Y - \bar{Y})^2$	$(X - \bar{X})(Y - \bar{Y})$
5	3	-7	5	49	25	-35
8	6	-4	8	16	64	-32
5	1	3	11	9	12	33
2	1	0	3	0	9	0
1	6	-1	-2	1	4	2
6	2	4	-6	16	36	-24
9	1	-3	-7	09	49	+21
8	0	6	-8	36	64	-48
4	3	2	-5	4	25	-48
2	9	0	1	0	1	100
20	80	0	0	140	398	-93

Here  $\bar{X} = \frac{\sum X}{n} = \frac{320}{10} = 32$  and  $\bar{Y} = \frac{\sum Y}{n} = \frac{380}{10} = 38$

Coefficient of regression of Y on X is

$$b_{YX} = \frac{\sum(X - \bar{X})(Y - \bar{Y})}{\sum(X - \bar{X})^2} = \frac{-93}{140} = -0.6643$$

Coefficient of regression of X on Y is

$$b_{XY} = \frac{\sum(X - \bar{X})(Y - \bar{Y})}{\sum(Y - \bar{Y})^2} = \frac{-93}{398} = -0.2337$$

Equation of the line of regression of X and Y is

$$\begin{aligned}
 X - \bar{X} &= b_{XY}(Y - \bar{Y}) \\
 X - 32 &= -0.2337(y - 38) \\
 X &= -0.2337y + 0.2337 \times 38 + 32 \\
 X &= -0.2337y + 40.8806
 \end{aligned}$$

Equation of the line of regression of Y on X is

$$\begin{aligned}
 Y - \bar{Y} &= b_{YX}(X - \bar{X}) \\
 Y - 38 &= -0.6643(x - 32) \\
 Y &= -0.6643x + 38 + 0.6643 \times 32 \\
 &= -0.6643x + 59.2576
 \end{aligned}$$

Coefficient of Correlation

$$\begin{aligned}
 r^2 &= b_{YX} \times b_{XY} \\
 &= -0.6643 \times (-0.2337) \\
 r &= 0.1552 \\
 r &= \pm \sqrt{0.1552} \\
 r &= \pm \sqrt{0.394}
 \end{aligned}$$

Now we have to find the most likely mark, in statistics (Y) when marks in economics (X) are 30.

$$\begin{aligned}
 y &= -0.6643x + 59.2575 \\
 \text{Put } x &= 30, \text{ we get} \\
 y &= -0.6643 \times 30 + 59.2536 \\
 &= 39.3286 \\
 y &\simeq 39
 \end{aligned}$$

## 2.4 COVARIANCE

**Def :** If X and Y are random variables, then Covariance between X and Y is defined as

$$\begin{aligned}
 \text{Cov}(X, Y) &= E(XY) - E(X) \cdot E(Y) \\
 \text{Cov}(X, Y) &= 0 \quad \text{[If X \& Y are independent]}
 \end{aligned}$$

### 2.4.1 CORRELATION

Types of Correlation

- Positive Correlation  
(If two variables deviate in same direction)
- Negative Correlation  
(If two variables constantly deviate in opposite direction)

### 2.4.2 KARL-PEARSON'S COEFFICIENT OF CORRELATION

Correlation coefficient between two random variables X and Y usually denoted by r(X, Y) is a numerical measure of linear relationship between them and is defined as

$$r(X, Y) = \frac{\text{Cov}(X, Y)}{\sigma_X \cdot \sigma_Y},$$

$$\text{Where } \text{Cov}(X, Y) = \frac{1}{n} \sum XY - \bar{X} \bar{Y}$$

$$\sigma_x = \frac{\sum X}{n}; \quad \sigma_y = \frac{\sum Y}{n}$$

\* Limits of correlation coefficient

$$-1 \leq r \leq 1.$$

X & Y independent,  $\therefore r(X, Y) = 0.$

**Note :**Types of correlation based on 'r'.

Values of 'r'

r = 1

0 < r < 1

-1 < r < 0

r = 0

Correlation is said to be  
 perfect and positive  
 positive  
 negative  
 Uncorrelated

**SOLVED PROBLEMS ON CORRELATION**

**Example 2.4.1**

Calculated the correlation coefficient for the following heights of fathers X and their sons

Y.

	5	6	7	7	8	9	0	2
	7	8	5	8	2	2	9	1

**Solution**

		U = X - 68	V = Y - 68	U V	U <sup>2</sup>	V <sup>2</sup>
5	7	-3	-1	3	9	1
6	8	-2	0	0	4	0
7	5	-1	-3	3	1	9
7	8	-1	0	0	1	0
8	2	0	4	0	0	16
9	2	1	4	4	1	16
0	9	2	1	2	4	1
2	1	4	3	12	16	9

$$\sum U = 0 \quad \sum V = 0 \quad \sum UV = 24 \quad \sum U^2 = 36 \quad \sum V^2 = 52$$

Now

$$\bar{U} = \frac{\sum U}{n} = \frac{0}{8} = 0$$

$$\bar{V} = \frac{\sum V}{n} = \frac{8}{8} = 1$$

$$\text{Cov}(X, Y) = \text{Cov}(U, V)$$

$$\Rightarrow \frac{\sum UV}{n} - \bar{U}\bar{V} = \frac{24}{8} - 0 = 3 \quad (1)$$

$$\sigma_U = \sqrt{\frac{\sum U^2}{n} - \bar{U}^2} = \sqrt{\frac{36}{8} - 0} = 2.121 \quad (2)$$

$$\sigma_V = \sqrt{\frac{\sum V^2}{n} - \bar{V}^2} = \sqrt{\frac{52}{8} - 1} = 2.345 \quad (3)$$

$$\begin{aligned} \therefore r(X, Y) &= r(U, V) = \frac{\text{Cov}(U, V)}{\sigma_U \cdot \sigma_V} = \frac{3}{2.121 \times 2.345} \\ &= 0.6031 \quad (\text{by 1, 2, 3}) \end{aligned}$$

### Example :2.4.2

Let  $X$  be a random variable with p.d.f.  $f(x) = \frac{1}{2}, -1 \leq x \leq 1$  and let  $Y = x^2$ , find the correlation coefficient between  $X$  and  $Y$ .

### Solution

$$\begin{aligned} E(X) &= \int_{-\infty}^{\infty} x.f(x) dx \\ &= \int_{-1}^1 x \cdot \frac{1}{2} dx = \frac{1}{2} \left( \frac{x^2}{2} \right)_{-1}^1 = \frac{1}{2} \left( \frac{1}{2} - \frac{1}{2} \right) = 0 \end{aligned}$$

$$E(X) = 0$$

$$\begin{aligned} E(Y) &= \int_{-\infty}^{\infty} x^2.f(x) dx \\ &= \int_{-1}^1 x^2 \cdot \frac{1}{2} dx = \frac{1}{2} \left( \frac{x^3}{3} \right)_{-1}^1 = \frac{1}{2} \left( \frac{1}{3} + \frac{1}{3} \right) = \frac{1}{2} \cdot \frac{2}{3} = \frac{1}{3} \end{aligned}$$

$$E(XY) = E(XX^2)$$

$$= E(X^3) = \int_{-\infty}^{\infty} x^3.f(x) dx = \left( \frac{x^4}{4} \right)_{-1}^1 = 0$$

$$E(XY) = 0$$

$$\therefore r(X, Y) = \rho(X, Y) = \frac{\text{Cov}(X, Y)}{\sigma_X \sigma_Y} = 0$$

$$\rho = 0.$$

Note :  $E(X)$  and  $E(XY)$  are equal to zero, noted not find  $\sigma_x$  &  $\sigma_y$ .

## 2.5 TRANSFORMS OF TWO DIMENSIONAL RANDOM VARIABLE

### Formula:

$$f_U(u) = \int_{-\infty}^{\infty} f_{u,v}(u, v) dv$$

$$\& \quad f_V(u) = \int_{-\infty}^{\infty} f_{u,v}(u, v) du$$

$$f_{UV}(u, V) = f_{XY}(x, y) \left| \frac{\partial(x, y)}{\partial(u, v)} \right|$$

### Example : 2.5.1

If the joint pdf of  $(X, Y)$  is given by  $f_{xy}(x, y) = x+y$ ,  $0 \leq x, y \leq 1$ , find the pdf of  $U = XY$ .

### Solution

Given  $f_{xy}(x, y) = x + y$

Given  $U = XY$

Let  $V = Y$

$$x = \frac{u}{v} \quad \& \quad y = V$$

$$\frac{\partial x}{\partial u} = \frac{1}{V} \cdot \frac{\partial x}{\partial v} = \frac{-u}{V^2}; \quad \frac{\partial y}{\partial u} = 0; \quad \frac{\partial y}{\partial v} = 1 \quad (1)$$

$$\therefore J = \left| \frac{\partial(x, y)}{\partial(u, v)} \right| = \begin{vmatrix} \frac{\partial y}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial v} & \frac{\partial x}{\partial u} \end{vmatrix} = \begin{vmatrix} 0 & \frac{-u}{V^2} \\ 1 & \frac{1}{V} \end{vmatrix} = \frac{1}{v} - 1 = \frac{1}{v}$$

$$\Rightarrow |J| = \frac{1}{V} \quad (2)$$

The joint p.d.f.  $(u, v)$  is given by

$$f_{uv}(u, v) = f_{xy}(x, y) |J|$$

$$= (x + y) \frac{1}{|v|}$$

$$= \frac{1}{V} \left( \frac{u}{v} + u \right) \quad (3)$$

The range of  $V$  :

Since  $0 \leq y \leq 1$ , we have  $0 \leq V \leq 1$  ( $\because V = y$ )

The range of  $u$  :

Given  $0 \leq x \leq 1$

$$\Rightarrow 0 \leq \frac{u}{v} \leq$$

$$\Rightarrow 0 \leq u \leq v$$

Hence the p.d.f. of (u, v) is given by

$$f_{uv}(u, v) = \frac{1}{v} \left( \frac{u}{v} + v \right), 0 \leq u \leq v, 0 \leq v \leq 1$$

Now

$$\begin{aligned} f_U(u) &= \int_{-\infty}^{\infty} f_{u,v}(u, v) dv \\ &= \int_u^1 f_{u,v}(u, v) dv \\ &= \int_u^1 \left( \frac{u}{v^2} + 1 \right) dv \\ &= \left[ v + u \cdot \frac{v^{-1}}{-1} \right]_u^1 \end{aligned}$$

$$\therefore f_u(u) = 2(1-u), 0 < u < 1$$

p.d.f of (u, v)

$$f_{uv}(u, v) = \frac{1}{v} \left( \frac{u}{v} + v \right)$$

$$0 \leq u \leq v, 0 \leq v \leq 1$$

p.d.f of u = XY

$$f_u(u) = 2(1-u), 0 < u < 1$$

### TUTORIAL QUESTIONS

1. The jpdf of r.v X and Y is given by  $f(x,y)=3(x+y), 0 < x < 1, 0 < y < 1, x+y < 1$  and 0 otherwise. Find the marginal pdf of X and Y and ii) Cov(X, Y).

2. Obtain the correlation coefficient for the following data:

X:	68	64	75	50	64	80	75	40	55	64
Y:	62	58	68	45	81	60	48	48	50	70

3. The two lines of regression are  $8X-10Y+66=0, 4X-18Y-214=0$ . The variance of x is 9 find i) The mean value of x and y. ii) Correlation coefficient between x and y.

4. If  $X_1, X_2, \dots, X_n$  are Poisson variates with parameter  $\lambda=2$ , use the central limit theorem to find  $P(120 \leq S_n \leq 160)$  where  $S_n = X_1 + X_2 + \dots + X_n$  and  $n=75$ .

5. If the joint probability density function of a two dimensional random variable (X, Y) is

given by  $f(x, y) = x^2 + y^2, 0 < x < 1, 0 < y < 2 = 0$ , elsewhere Find (i)  $P(X > 1/2)$  (ii)  $P(Y < X)$  and (iii)  $P(Y < 1/2 / X < 1/2)$ .

6. Two random variables X and Y have joint density  
Find Cov (X, Y).

7. If the equations of the two lines of regression of y on x and x on y are respectively

$7x-16y+9=0$ ;  $5y-4x-3=0$ , calculate the coefficient of correlation.

### WORKEDOUT EXAMPLES

#### Example 1

The j.d.f of the random variables X and Y is given

$$f(x, y) = \begin{cases} 8xy, & 0 < x < 1, \quad 0 < y < x \\ 0, & \text{otherwise} \end{cases}$$

Find (i)  $f_X(x)$  (ii)  $f_Y(y)$  (iii)  $f(y/x)$

#### Solution

We know that

(i) The marginal pdf of 'X' is

$$f_X(x) = f(x) = \int_{-\infty}^{\infty} f(x, y) dy = \int_0^x 8xy dy = 4x^3$$

$$f(x) = 4x^3, \quad 0 < x < 1$$

(ii) The marginal pdf of 'Y' is

$$f_Y(y) = f(y) = \int_{-\infty}^{\infty} f(x, y) dx = \int_0^1 8xy dx = 4y$$

$$f(y) = 4y, \quad 0 < y < \alpha$$

(iii) We know that

$$\begin{aligned} f(y/x) &= \frac{f(x, y)}{f(x)} \\ &= \frac{8xy}{4x^3} = \frac{2y}{x^2}, \quad 0 < y < x, \quad 0 < x < 1 \end{aligned}$$

#### Example 2

Let X be a random variable with p.d.f.  $f(x) = \frac{1}{2}, -1 \leq x \leq 1$  and let  $Y = x^2$ , find the correlation coefficient between X and Y.

#### Solution

$$E(X) = \int_{-\infty}^{\infty} x.f(x) dx$$

$$= \int_{-1}^1 x \cdot \frac{1}{2} dx = \frac{1}{2} \left( \frac{x^2}{2} \right)_{-1}^1 = \frac{1}{2} \left( \frac{1}{2} - \frac{1}{2} \right) = 0$$

$$E(X) = 0$$

$$E(Y) = \int_{-\infty}^{\infty} x^2.f(x) dx$$

$$= \int_{-1}^1 x^2 \cdot \frac{1}{2} dx = \frac{1}{2} \left( \frac{x^3}{3} \right)_{-1}^1 = \frac{1}{2} \left( \frac{1}{3} + \frac{1}{3} \right) = \frac{1}{2} \cdot \frac{2}{3} = \frac{1}{3}$$

$$\begin{aligned}
 E(XY) &= E(XX^2) \\
 &= E(X^3) = \int_{-\infty}^{\infty} x^3 \cdot f(x) \, dx = \left( \frac{x^4}{4} \right)_{-1}^1 = 0
 \end{aligned}$$

$$E(XY) = 0$$

$$\therefore r(X, Y) = \rho(X, Y) = \frac{\text{Cov}(X, Y)}{\sigma_X \sigma_Y} = 0$$

$$\rho = 0.$$

Note :  $E(X)$  and  $E(XY)$  are equal to zero, noted not find  $\sigma_x$  &  $\sigma_y$ .

### Result

Marginal pdf g	Marginal pdf y	F(y/x)
$4x^3, 0 < x < 1$	$4y, 0 < y < x$	$\frac{2y}{x^2}, 0 < y < x, 0 < x < 1$

## UNIT – III

### RANDOM PROCESSES

#### Introduction

In chapter 1, we discussed about random variables. Random variable is a function of the possible outcomes of a experiment. But, it does not include the concept of time. In the real situations, we come across so many time varying functions which are random in nature. In electrical and electronics engineering, we studied about signals.

Generally, signals are classified into two types.

- (i) Deterministic
- (ii) Random

Here both deterministic and random signals are functions of time. Hence it is possible for us to determine the value of a signal at any given time. But this is not possible in the case of a random signal, since uncertainty of some element is always associated with it. The probability model used for characterizing a random signal is called a random process or stochastic process.

#### 3.1 Random Process (Definition):

A random process is a collection of random variables  $\{X(s,t)\}$  that are fxy of a real variable, namely time  $t$  where  $s \in S$  and  $t \in T$  ( $S$ : Sample space  $\theta$   $t$  parameters set or under set).

#### 3.2 Classification of Random Process

We shall consider only four cases based on  $t$ .

- 1) Continuous Random Process.
- 2) Continuous Random Sequence.
- 3) Discrete Random Process.
- 4) Discrete Random Sequence.

#### Statistical (Ensemble) Averages:

$$1. \text{ Mean} = E[X(t)] = \int_{-\infty}^{\infty} xf(x,t)dx$$

2. Auto correlation fy of  $[x(t)]$

$$\begin{aligned} R_{xx}(t_1, t_2) &= E[X(t_1)X(t_2)] \\ &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} x_1 x_2 f(x_1, x_2, t_1, t_2) dx_1 dx_2 \end{aligned}$$

(or)

$$R_{xx}(t_1 + t_2 + \tau) = E[X(t)X(t + \tau)]$$

When  $\tau = \text{time difference} = t_2 - t_1$

3) Auto covariance of  $[X(t)]$

$$C_{XX}(t_1, t_2) = R_{XX}(t_1, t_2) - E[X(t_1)]E[X(t_2)]$$

$$C_{XX}(t, t) = E[X^2(t)] - E[X(t)]^2 \quad [ \because t_1 = t_2 = t ]$$

$$= \text{Var} [X(t)]$$

4) Correlation coefficient of  $[X(t)]$

$$\rho_{XX}(t_1, t_2) = \frac{C_{XX}(t_1, t_2)}{\sqrt{C_{XX}(t_1, t_1)C_{XX}(t_2, t_2)}}$$

$$\text{Note : } \rho_{XX}(t/t) = 1$$

5) Cross correlation

$$R_{XY}(t_1, t_2) = E[X(t_1)Y(t_2)]$$

(or)

$$R_{XY}(t, t + \tau) = E[X(t)Y(t + \tau)]$$

6) Cross Covariance

$$C_{XY}(t_1, t_2) = R_{XY}(t_1, t_2) - E[X(t_1)]E[Y(t_2)]$$

$$\text{Or } C_{XY}(t, t + \tau) = R_{XY}(t, t + \tau) - E[X(t)]E[Y(t + \tau)]$$

Cross Correlation Coefficient

$$\rho_{XY}(t_1, t_2) = \frac{C_{XY}(t_1, t_2)}{\sqrt{C_{XY}(t_1, t_1)C_{XY}(t_2, t_2)}}$$

### 3.3 FIRST ORDER STRICTLY STATIONARY PROCESS

**Stationary Process (or) Strictly Stationary Process (or) Strict Sense Stationary Process [SSS Process]**

A random process  $X(t)$  is said to be stationary in the strict sense, if its statistical characteristics do not change with time.

Stationary Process:

$$\text{Formula: } E[X(t)] = \text{Constant}$$

$$\gamma[X(t)] = \text{Constant}$$

1) Consider the RP  $X(t) = \cos(\omega_0 t + \theta)$  where  $\theta$  is uniformly distributed in the interval  $-\pi$  to  $\pi$ . Check whether  $X(t)$  is stationary or not? Find the first and Second moments of the process.

Given  $X(t) = \cos(\omega_0 t + \theta)$

Where  $\theta$  is uniformly distributed in  $(-\pi, \pi)$

$$f(\theta) = \frac{1}{\pi - (-\pi)} - \frac{1}{2\pi}, \quad -\pi < \theta < \pi \quad [\text{from the def. of uniform distribution}]$$

To prove

- (i)  $X(t)$  is SSS process
- (ii)  $E[X(t)] = \text{Constant}$
- (iii)  $\text{Var} [X(t)] = \text{Constant}$

$$\begin{aligned}
E[X(t)] &= \int_{-\infty}^{\infty} X(t)f(\theta)d\theta \\
&= \int_{-\pi}^{\pi} \cos(w_0t + \theta) \cdot \frac{1}{2\pi} d\theta \\
&= \frac{1}{2\pi} [\sin(w_0t + \theta)]_{-\pi}^{\pi} \\
&= \frac{1}{2\pi} [\sin w_0t + \pi] + \sin[\pi - w_0t] \\
&= \frac{1}{2\pi} [-\sin w_0t + \sin w_0t] = 0
\end{aligned}$$

$$\begin{aligned}
E[X^2(t)] &= E[w_s^2(w_0t + \theta)] \\
&= \frac{1}{2} E[1 + \cos(2w_0t + 2\theta)]
\end{aligned}$$

$$E[1] = \int_{-\pi}^{\pi} \frac{1}{2\pi} d\theta = 1$$

$$\begin{aligned}
E[\cos(2w_0t + 2\theta)] &= \int_{-\pi}^{\pi} \cos(2w_0t + 2\theta) \cdot \frac{1}{2} \pi \\
&= \frac{1}{2\pi} \left[ \sin \frac{(2\omega_0t + 2\theta)}{2} \right]_{-\pi}^{\pi} \\
&= \frac{1}{4\pi} [0] = 0
\end{aligned}$$

$$\therefore \Rightarrow E[X^2(t)] = \frac{1}{2}(1) + 0 = Y_2$$

$$\begin{aligned}
\text{Var}[X(t)] &= E[X^2(t)] - [E[X(t)]]^2 \\
&= \frac{1}{2} - 0 \\
&= \frac{1}{2} = \text{const}
\end{aligned}$$

$\therefore X(t)$  is a SSS Process./

S.T the RP  $X(t): A \cos(w_0t + \theta)$  is not stationary if  $A$  and  $w_0$  are constants and  $\theta$  is uniformly distributed random variable in  $(0, \pi)$ .

$$\text{In } X(t) = A \cos(w_0t + \theta)$$

In ' $\theta$ ' uniformly distributed

$$f(\theta) = \frac{1}{\pi - 0} = \frac{1}{\pi} \quad 0 < \theta < \pi$$

$$\begin{aligned}
E[X(t)] &= \int_{-\infty}^{\infty} X(t) f(\theta) d\theta \\
&= \int_0^{\pi} A \cos(w_0 t + \theta) \frac{1}{\pi} d\theta \\
&= \frac{A}{\pi} [\sin(w_0 t + \theta)]_0^{\pi} \\
&= -\frac{2A}{\pi} \sin w_0 t \neq \text{const.}
\end{aligned}$$

$\therefore N(t)$  is not a stationary process.

### 3.3.1 SECOND ORDER AND WIDE SENSE STATIONARY PROCESS

A Process is said to be second order stationary, if the second order density function statistics.

$$f(x_1, x_2 : t_1, t_2) = f(x_1, x_2 : t + \delta, t_2 + \delta), \forall x_1, x_2 \text{ and } \delta$$

If a random process  $X(t)$  is WSS then it must also be covariance stationary.

In  $X(t)$  is WSS

i)  $E[X(t)] = \mu = \text{a const.}$

(ii)  $R(t_1, t_2) = \text{a fn of } (t_1 - t_2)$

The auto covariance fn is gn by

$$\begin{aligned}
C(t_1, t_2) &= R(t_1, t_2) - E[X(t_1)X(t_2)] \\
&= R(t_1 - t_2) - E[X(t_1)]E[X(t_2)] \\
&= R(t_1 - t_2) - \mu(\mu) \\
&= R(t_1 - t_2) - \mu^2
\end{aligned}$$

Which depends only on the time difference. Hence  $X(t)$  is covariance stationary.

If  $X(t)$  is a wide sense stationary process with auto correlation  $R(\tau) = Ae^{-\alpha(\tau)}$ , determine the second order moment of the random variable  $X(8) - X(5)$ .

$$\text{Given } R(\tau) = Ae^{-\alpha(\tau)}$$

$$R(t_1, t_2) = Ae^{-\alpha(t_1 - t_2)}$$

$$E[X^2(t)] = R(t, t) = A$$

$$E[X^2(8)] = A$$

$$E[X^2(5)] = A$$

$$E[X(8)X(15)] = R|8,5| = Ae^{-\alpha(8,5)}$$

$$= Ae^{-3\alpha}$$

The second moment of  $X(8) - X(5)$  is given by

$$E[X(8) - X(15)]^2 = E[X^2(8)] + E[X^2(5)] - 2E[X(8)X(5)]$$

$$= A + A - 2Ae^{-3\alpha}$$

$$= 2A(1 - e^{-3\alpha})$$

**Example:3.3.1**

S.T the random process  $X(t) = A \cos(wt + \theta)$  is wide sense stationary if  $A$  &  $w$  are constants and  $\theta$  is uniformly distributed random variable in  $(0, 2\pi)$ .

Given  $X(t) = A \cos(wt + \theta)$

$$f(\theta) = \frac{1}{2\pi - 0} = \begin{cases} \frac{1}{2\pi}, & 0 < \theta < 2\pi \\ 0, & \text{otherwise} \end{cases}$$

$$f(\theta) = \frac{1}{2\pi}$$

To prove  $X(t)$  is WSS

(i)  $E[X(t)] = \text{Constant}$

(ii)  $R(t_1, t_2) = \text{a fn of } (t_1 - t_2)$

(i)  $E[X(t)] = \int_{-\infty}^{\infty} X(t)f(\theta)d\theta$

$$\Rightarrow E[A \cos(wt + \theta)] = \int_{-\infty}^{\infty} A \cos(wt + \theta) f(\theta) d\theta$$

$$= \text{constant}$$

(ii)  $R(t_1, t_2) = E[X(t_1)X(t_2)]$

$$= E[A \cos(wt_1 + \theta) A \cos(wt_2 + \theta)]$$

$$= E[A^2 \cos(wt_1 + \theta) \cos(wt_2 + \theta)]$$

$$= \frac{A^2}{2} E[\cos w(t_1 + t_2) + 2\theta] + \frac{A^2}{2} \cos[w(t_1 - t_2)]$$

$$= 0$$

$$\Rightarrow R(t_1, t_2) = \frac{A^2}{2} \cos[w(t_1 - t_2)]$$

= a fn of  $(t_1 - t_2)$

Hence  $X(t)$  is a WSS Process.

**Example3.3.2**

If  $X(t) = A \cos \lambda t + B \sin \lambda t$ , where  $A$  and  $B$  are two independent normal random variable with  $E(A) = E(B) = 0$ ,  $E(A^2) = E(B^2) = \sigma^2$ , where  $\lambda$  is a constant. Prove that  $\{X(t)\}$  is a Strict Sense Stationary Process of order 2 (or)

If  $X(t) = A \cos \lambda t + B \sin \lambda t$ ,  $t \geq 0$  is a random process where  $A$  and  $B$  are independent  $N(0, \sigma^2)$  random variable, Examine the WSS process  $X(t)$ .

Given  $X(t) : A \cos \lambda t + B \sin \lambda t$  ----- (1)

$E(A) = 0; \quad E(B) = 0$  ----- (2)

$$E(A^2) = \sigma^2 = k; E(B^2) = \sigma^2 = k$$

$$E[AB] = E[A]E[B] \quad [\because A \text{ \& B are independent}]$$

$$= 0$$

To prove :  $X(t)$  is WSS Process

i.e. (i)  $E[X(t)] = \text{Constant}$

(ii)  $R(t_1, t_2) = \text{a fn of } (t_1 - t_2)$

$$E[X(t)] = E[A \cos \lambda t + B \sin \lambda t]$$

$$= \cos \lambda t E[A] + \sin \lambda t E[B]$$

$$= 0$$

$$R(t_1, t_2) = E[X(t_1)X(t_2)]$$

$$= E[(A \cos \lambda t_1 + B \sin \lambda t_1)(A \cos \lambda t_2 + B \sin \lambda t_2)]$$

$$= E[A^2 \cos \lambda t_1 \cos \lambda t_2 + B^2 \sin \lambda t_1 \sin \lambda t_2 +$$

$$AB \cos \lambda t_1 \sin \lambda t_2 + \sin \lambda t_1 \cos \lambda t_2]$$

$$= \cos \lambda t_1 \cos \lambda t_2 E[A^2] + \sin \lambda t_1 \sin \lambda t_2 E[B^2]$$

$$+ E[AB] [\sin(\lambda t_1 + \lambda t_2)]$$

$$= K \cos \lambda t_1 \cos \lambda t_2 + K \sin \lambda t_1 \sin \lambda t_2 + 0$$

$$= K \cos \lambda(t_1 - t_2)$$

$$= \text{a fn of } (t_1 - t_2)$$

Both the conditions are satisfied. Hence  $X(t)$  is a WSS Process.

### Example:3.3.3

Consider a random process  $X(t)$  defined by  $N(t) = U \cos t + (V + 1) \sin t$ , where  $U$  and  $V$  are independent random variables for which  $E(U) = E(V) = 0$ ,  $E(U^2) = E(V^2) = 1$ . Is  $X(t)$  is WSS? Explain your answer?

Given  $X(t) = U \cos t + (V + 1) \sin t$

$$E(U) = E(V) = 0$$

$$E(U^2) = E(V^2) = 1$$

$$E(UV) = E(U)E(V) = 0$$

$$E[X(t)] = E[V \cos t + (V + 1) \sin t]$$

$$= E(U) \cos t + E(V) \sin t + \sin t$$

$$= 0 + 0 + \sin t$$

$$= \sin t$$

$$\neq \text{a constant}$$

$\Rightarrow X(t)$  is not a WSS Process.

**3.3.2 ERGODIC PROCESS**

Ergodic Process are processes for which time and ensemble (statistical) averages are interchangeable the concept of ergodicity deals with the equality of time and statistical average.

**Time Average**

If  $X(t)$  is a random process, then  $\frac{1}{2\pi} \int_{-T}^T X(t) dt$  is called the time average of  $X(t)$  over  $(-T, T)$  and is denoted by  $\bar{X}_T$ .

**Note**

1.  $\bar{X}_T = \frac{1}{2\pi} \int_{-T}^T X(t) dt$ ,  $X(t)$  defined in  $(-T, T)$
2.  $\bar{X}_T = \frac{1}{T} \int_0^T X(t) dt$ ,  $D(t)$  defined in  $(0, T)$

**3.4 MARKOV PROCESS - MARKOV CHAINS**

**3.4.1 Markov Process**

A random process  $X(t)$  is said to be Markov Process, if

$$P \left[ X(t) \leq \frac{x}{X(t_1)} - x_1, X(t_2) = x_2 \dots X(t_n) = x_n \right] = P \left[ X(t) \leq \frac{x}{X(t_n)} = x_n \right]$$

**3.4.2 Markov Chain**

A discrete parameter Markov Process is called Markov Chain.

If the tmp of a Markov Chain is  $\begin{bmatrix} 0 & 1 \\ 1/2 & 1/2 \end{bmatrix}$ , find the steady state distribution of the chain.

Given  $P = \begin{bmatrix} 0 & 1 \\ 1/2 & 1/2 \end{bmatrix}$

If  $\pi = (\pi_1 \pi_2)$  is the steady state distribution of the chain, then by the property of  $\pi$ , we have

$$\pi P = \pi \quad \text{-----(1)}$$

$$\pi_1 + \pi_2 = 1 \quad \text{-----(2)}$$

$$\Rightarrow (\pi_1 \pi_2) \begin{bmatrix} 0 & 1 \\ 1/2 & 1/2 \end{bmatrix} = (\pi_1 \pi_2)$$

$$[\pi_1 [0] + \pi_2 (1/2) + \pi_1 (1) + \pi_2 (1/2)] = [\pi_1 \pi_2]$$

$$\frac{1}{2}\pi_2 = \pi_1 \quad \text{----- (3)}$$

$$\pi_1 + \frac{1}{2}\pi_2 = \pi_2 \quad \text{----- (4)}$$

$$\pi_1 + \pi_2 = 1$$

$$\frac{1}{2}\pi_2 + \pi_2 = 1 \Rightarrow \frac{3}{2}\pi_2 = 1 \quad \text{by (3)}$$

$$\pi_2 = \frac{2}{3}$$

$$(3) \Rightarrow \pi_1 = \frac{1}{2}\pi_2 = \frac{1}{2}\left(\frac{2}{3}\right) = \frac{1}{3}$$

$\therefore$  The steady state distribution of the chain is  $\pi = (\pi_1 \pi_2)$

i.e.  $\pi = \left(\frac{1}{3} \frac{2}{3}\right)$

### Example :3.4.1

An Engineering analysing a series of digital signals generated by a testing system observes that only 1 out of 15 highly distorted signals followed a highly distorted signal with no recognizable signal, where as 20 out of 23 recognizable signals follow recognizable signals with no highly distorted signals b/w. Given that only highly distorted signals are not recognizable. Find the fraction of signals that are highly distorted.

$\pi_1$  = The fraction of signals that are recognizable [R]

$\pi_2$  = The fraction of signals that are highly distorted [D]

The tmp of the Markov Chain is

$$P = \begin{array}{c} \begin{array}{cc} & \begin{array}{c} \text{R} \\ \text{D} \end{array} \\ \begin{array}{c} \text{R} \\ \text{D} \end{array} & \begin{bmatrix} \frac{20}{23} & - \\ - & \frac{1}{15} \end{bmatrix} \end{array} \Rightarrow P = \begin{bmatrix} \frac{20}{23} & \frac{3}{23} \\ \frac{14}{15} & \frac{1}{15} \end{bmatrix}$$

- 1 out of 15 highly distorted signals followed a highly distorted signal with no recognizable signal

$$[P(D \rightarrow D)] = \frac{1}{15}$$

- 20 out of 23 recognizable signals follow recognizable signals with no highly distorted signals.

- If the tmp of a chain is a stochastic martin, then the sum of all elements of any row is equal to 1.

If  $\pi = (\pi_1 \pi_2)$  is the steady state distribution of the chain, then by the property of  $\pi$ , we have

$$\pi P = \pi$$

$$\pi_1 + \pi_2 = 1$$

$$\Rightarrow (\pi_1 \pi_2) \begin{bmatrix} 20/23 & 3/23 \\ 14/15 & 1/15 \end{bmatrix} = (\pi_1 \pi_2)$$

$$20/23 \pi_1 + 14/15 \pi_2 = \pi_1 \quad \text{-----(3)}$$

$$3/23 \pi_1 + 1/15 \pi_2 = \pi_2 \quad \text{-----(4)}$$

$$(3) \quad \pi_2 = 45/322 \pi_1$$

$$\Rightarrow \pi_1 = 322/367$$

$$(2) \quad \pi_2 = 45/367$$

∴ The steady state distribution of the chain is

$$\pi = (\pi_1 \pi_2)$$

$$\text{i.e.} \quad \pi = \left( \frac{322}{367} \quad \frac{45}{367} \right)$$

$$\therefore \text{The fraction of signals that are highly distorted is } \frac{45}{367}$$

$$\Rightarrow \frac{45}{367} \times 100\% = 12.26\%$$

**Example :3.4.2**

Transition prob and limiting distribution. A housewife buys the same cereal in successive weeks. If she buys cereal A, the next week she buys cereal B. However if she buys B or C, the next week she is 3 times as likely to buy A as the other cereal. In the long run how often she buys each of the 3 cereals.

Given : Let  $\pi_1 \rightarrow$  Cereal A  
 $\pi_2 \rightarrow$  Cereal B  
 $\pi_3 \rightarrow$  Cereal C

∴ the tpm of the Markov Chain is

$$P = \begin{bmatrix} 0 & 1 & - \\ 3/4 & 0 & - \\ 3/4 & - & 0 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 3/4 & 0 & 1/4 \\ 3/4 & 1/4 & 0 \end{bmatrix}$$

If  $\pi = (\pi_1, \pi_2, \pi_3)$  is the steady - state distribution of the chain then by the property of  $\pi$  we have,

$$\pi P = \pi$$

$$\pi_1 + \pi_2 + \pi_3 = 1$$

$$\Rightarrow (\pi_1 \pi_2 \pi_3) \begin{bmatrix} 0 & 1 & 0 \\ 3/4 & 0 & 1/4 \\ 3/4 & 1/4 & 0 \end{bmatrix} \\ = [\pi_1 \pi_2 \pi_3]$$

$$\frac{3}{4}\pi_2 + \frac{3}{4}\pi_3 = \pi_1 \quad (3)$$

$$\pi_1 + \frac{1}{4}\pi_3 = \pi_2 \quad (4)$$

$$\frac{1}{4}\pi_2 = \pi_3 \quad (5)$$

$$(3) \Rightarrow \frac{3}{4}\pi_2 + \frac{3}{4}\left(\frac{1}{4}\pi_2\right) = \pi_1 \quad (\text{by } 5)$$

$$\frac{15}{16}\pi_2 = \pi_1 \quad (6)$$

$$(2) \Rightarrow \pi_1 + \pi_2 + \pi_3 = 1$$

$$\frac{15}{16}\pi_2 + \pi_2 + \frac{1}{4}\pi_2 = 1 \quad \text{by (5) \& (6)}$$

$$\frac{35}{16}\pi_2 = 1$$

$$\pi_2 = \frac{16}{35}$$

$$(6) \Rightarrow \pi_1 = \frac{15}{16}\pi_2$$

$$\pi_1 = \frac{15}{35}$$

$$(5) \Rightarrow \pi_3 = \frac{1}{4}\pi_2$$

$$\pi_3 = \frac{4}{35}$$

$\therefore$  The steady state distribution of the chain is

$$\pi = (\pi_1 \pi_2 \pi_3)$$

$$\text{i.e., } \pi = \left(\frac{15}{35} \quad \frac{16}{35} \quad \frac{4}{35}\right)$$

n - step tmp  $P^n$

**Example : 3.4.1** The transition Prob. Martix of the Markov Chain  $\{X_n\}$ ,  $n = 1,2,3,\dots$

having 3 states 1, 2 & 3 is  $P = \begin{bmatrix} 0.1 & 0.5 & 0.4 \\ 0.6 & 0.2 & 0.2 \\ 0.3 & 0.4 & 0.3 \end{bmatrix}$  and the initial distribution is

$$P^{(0)} = (0.7 \quad 0.2 \quad 0.1).$$

Find (i)  $P(X_2 = 3)$  and (ii)  $P[X_3 = 2, X_2 = 3, X_1 = 3, X_0 = 2]$

**Solution**

Given  $P^{(0)} = (0.7 \ 0.2 \ 0.1)$ .

$$\Rightarrow P[X_0 = 1] = 0.7$$

$$P(X_0 = 2) = 0.2$$

$$P[X_0 = 3] = 0.1$$

$$P = \begin{bmatrix} 0.1 & 0.5 & 0.4 \\ 0.6 & 0.2 & 0.2 \\ 0.3 & 0.4 & 0.3 \end{bmatrix}$$

$$= \begin{bmatrix} P_{11}^{(1)} & P_{12}^{(1)} & P_{13}^{(1)} \\ P_{21}^{(1)} & P_{22}^{(1)} & P_{23}^{(1)} \\ P_{31}^{(1)} & P_{32}^{(1)} & P_{33}^{(1)} \end{bmatrix}$$

$$P^2 = P \cdot P$$

$$= \begin{bmatrix} 0.43 & 0.31 & 0.26 \\ 0.24 & 0.42 & 0.34 \\ 0.36 & 0.35 & 0.29 \end{bmatrix}$$

$$= \begin{bmatrix} P_{11}^{(2)} & P_{12}^{(2)} & P_{13}^{(2)} \\ P_{21}^{(2)} & P_{22}^{(2)} & P_{23}^{(2)} \\ P_{31}^{(2)} & P_{32}^{(2)} & P_{33}^{(2)} \end{bmatrix}$$

$$(i) P[X_2 = 3] = \sum_{i=1}^3 P[X_2 = 3 / X_0 = i] P[\lambda_0 = i]$$

$$= P[X_2 = 3 / X_0 = 1] P[X_0 = 1] + P[X_2 = 3 / X_0 = 2] P[X_0 = 2] +$$

$$P[X_2 = 3 / X_{0=3}] P[X_0 = 3]$$

$$= P_{13}^{(2)} P[X_0 = 1] + P_{23}^{(2)} P[X_0 = 2] + P_{33}^{(2)} P[X_0 = 3]$$

$$= (0.26)(0.7) + (0.34)(0.2) + (0.29)(0.1)$$

$$= 0.279$$

$$(ii) P[X_3 = 2, X_2 = 3, X_1 = 3, X_0 = 2]$$

$$= P_{32}^{(1)} P[X_2 = 3 / X_1 = 3, X_0 = 2] P[\lambda_1 = 3, X_0 = 2]$$

$$= P_{32}^{(1)} P_{33}^{(1)} P_{23}^{(1)} P[X_0 = 2]$$

$$= (0.4) (0.3) (0.2) (0.2)$$

$$= 0.0048$$

### 3.5 TYPE 5

A training process is considered as two State Markov Chain. If it rain, it is considered to be state 0 & if it does not rain the chain is in stable 1. The tmp of the Markov Chain is defined as

$$P = \begin{bmatrix} 0.6 & 0.4 \\ 0.2 & 0.8 \end{bmatrix}$$

- i. Find the Prob. That it will rain for 3 days from today assuming that it is raining today.
- ii. Find also the unconditional prob. That it will rain after 3 days with the initial Prob. Of state ) and state 1 as 0.4 & 0.6 respectively.

#### Solution:

$$\text{Given } P = \begin{bmatrix} 0.6 & 0.4 \\ 0.2 & 0.8 \end{bmatrix}$$

$$P^{(2)} = P^2 = \begin{bmatrix} 0.6 & 0.4 \\ 0.2 & 0.8 \end{bmatrix} \begin{bmatrix} 0.6 & 0.4 \\ 0.2 & 0.8 \end{bmatrix}$$

$$= \begin{bmatrix} 0.44 & 0.56 \\ 0.28 & 0.72 \end{bmatrix}$$

$$P^{(3)} = P^3 = P^2 P$$

$$= \begin{bmatrix} 0.376 & 0.624 \\ 0.312 & 0.688 \end{bmatrix}$$

- (i) If it rains today, then Prob. Distribution for today is (1 0)

$$\therefore P(\text{after 2 days}) = (1 \ 0) \begin{bmatrix} 0.376 & 0.624 \\ 0.312 & 0.688 \end{bmatrix}$$

$$= [0.376 \quad 0.624]$$

$$\therefore P[\text{Rain for after 3 days}] = 0.376$$

- (ii) Given  $P^{(0)} = (0.4 \quad 0.6)$

$$P[\text{after 3 days}] = (0.4 \quad 0.6) \begin{bmatrix} 0.376 & 0.624 \\ 0.312 & 0.688 \end{bmatrix}$$

$$= (0.3376 \quad 0.6624)$$

$$\therefore P[\text{rain for after 3 days}] = 0.3376$$

#### Example :3.5.1

Prove that the matrix  $\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix}$  is the tpm of an irreducible Markov Chain?

(or)

Three boys A, B, C are throwing a ball each other. A always throws the ball to B & B always throws the ball to C but C is just as like to throw the ball to B as to A. State that the process is Markov Chain. Find the tpm and classify the status.

The tpm of the given Markov chain is

$$P = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{2} & \frac{1}{2} & 0 \end{bmatrix}$$

(a) let  $X_n = \{1, 2, 3\} \Rightarrow$  finite

State 2 & 3 are communicate with each other  
 State 1 & 2 are communicate with each other  
 State 3 & 1 are communicate with each other through state 2.

$\Rightarrow$  The Markov Chain is irreducible (3)

From (1) & (2) all the states are persistent and non-null (3)

One can get back to

- State 1 in  $1 \rightarrow 2 \rightarrow 3 \rightarrow 1$  (3 steps)
- State 2 in  $2 \rightarrow 3 \rightarrow 2$  (2 steps)
- State 2 in  $2 \rightarrow 3 \rightarrow 1 \rightarrow 2$  (3 steps)
- State 3 in  $3 \rightarrow 1 \rightarrow 2 \rightarrow 3$  (3 steps)
- State 3 in  $3 \rightarrow 2 \rightarrow 2$  (2 steps)

$\Rightarrow$  The states are aperiodic (4)

[ $\because$  The states are not periodic]

From (3) & (4) we get all the states are Ergodic.

### 3.6 POISSON BINOMIAL PROCESS

If  $X(t)$  represents the no. of occurrences of certain even in  $(0, t)$ , then the discrete random process  $\{X(t)\}$  is called the Poisson process, provided the following postulate are satisfied.

- i.  $P[1 \text{ occurrence in } (t, t+\Delta t) = \lambda\Delta t$
- ii.  $P[0 \text{ occurrence in } (t, t+\Delta t) = 1 - \lambda\Delta t$
- iii.  $P[2 \text{ occurrence in } (t, t+\Delta t) = 0$
- iv.  $X(t)$  is independent of the no. of occurrences of the event in any interval prior and after the interval  $(0, t)$

v. The Prob. That the events occurs a specified no. of times in  $(t_0, t_0+t)$  depends only on  $t$ , but not on  $t_0$ .

Prob. Law for the Poisson Process  $\{X(t)\}$

$$P[X(t) = n] = P_n(t) = \frac{e^{-\lambda t} (\lambda t)^n}{n!}$$

$$n = 0, 1, 2, 3, \dots$$

### 3.7 BINOMIAL PROCESS

Let  $X_n, n = 1, 2, 3, \dots$  be a Bernoulli Process and  $S_n$  denote the No. of the successes in the 1st  $n$  Bernoulli trails i.e.,  $S_n = X_1 + X_2 + \dots + X_n$   $P[X_n = k] = \binom{n}{k} p^k q^{n-k}, k = 0, 1, 2, \dots$

#### Example:3.7.1

Suppose that customers arrive at a bank according to a Poisson Process with mean rate of 3 per minute. Find the Prob. That during a time interval of 2 minutes (i) exactly 4 customer arrive (ii) Greater than 4 customer arrive (iii) Fewer than 4 customer arrive.

$$\lambda = 3$$

$$P[X(t) = n] = \frac{e^{-\lambda t} (\lambda t)^n}{n!} \quad n = 0, 1, 2, \dots$$

$$= \frac{e^{-3t} (3t)^n}{n!} \quad n = 0, 1, \dots$$

P (Exactly 4 customers in 2 minutes)

$$= P[X(2) = 4] = \frac{e^{-6} 6^4}{4!} = 0.1338$$

(ii) P[more than 4 customers in 2 minutes]

$$= P[X(2) > 4] = 1 - P[X(2) \leq 4]$$

$$= 1 - e^{-6} \left[ 1 + 6 + \frac{6^2}{2!} + \frac{6^3}{3!} + \frac{6^4}{4!} \right]$$

$$= 0.7149$$

(iii) P[Fewer than 4 customer arrive in 2 minutes]

$$= P[X(2) < 4]$$

$$= e^{-6} \left[ 1 + 6 + \frac{6^2}{2!} + \frac{6^3}{3!} \right]$$

$$= 0.1512$$

#### Example:3.7.2

If customers arrive at a counter in accordance with a Poisson process with a mean rate of 2 per minute, find the Prob. that the interval b/w two consecutive arrivals is (i) more than 1 minute (ii) B/W 1 & 2 minute (iii) 4 minutes or less

$$\lambda = 2$$

$$(i) P[T > 1] = \int_1^{\infty} 2e^{-2t} dt = 0.1353$$

$$(ii) P[1 < T < 2] = 0.1170$$

$$(iii) P[T \leq 4] = \int_0^4 2e^{-2t} dt = 0.9996$$

### TUTORIAL PROBLEMS

1. Train. Now suppose that on the first day of the week, the man tossed a fair dice and drove to work if and only if a 6 appeared. Find (a) the probability that he takes a train on the third day and (b) the probability he drives to work in the long run

2. A gambler has Rs. 2/- . He bets Rs. 1 at a time and wins Rs. 1 with probability  $\frac{1}{2}$ . He stops playing if he loses Rs. 2 or wins Rs. 4. (a) What is the transition matrix of the related Markov chain? (b) What is the probability that he has lost this money at the end of 5 plays? (c) What is the probability that the same game lasts more than 7 plays

3. There are 2 white marbles in urn A and 3 red marbles in urn B. At each step of the process, a marble is selected from each urn and the 2 marbles selected are interchanged. Let the state  $a_i$  of the system be the number of red marbles in A after  $i$  changes. What is the probability that there are 2 red marbles in urn A?

4. Three boys A, B and C are throwing a ball to each other. A always throws the ball to B and B always throws the ball to C, but C is just as likely to throw the ball to B as to A. Show that the process is Markovian. Find the transition matrix and classify the states.

### WORKED OUT EXAMPLES

**Example :1** The transition Prob. Matrix of the Markov Chain  $\{X_n\}$ ,  $n = 1, 2, 3, \dots$  having

3 states 1, 2 & 3 is  $P = \begin{bmatrix} 0.1 & 0.5 & 0.4 \\ 0.6 & 0.2 & 0.2 \\ 0.3 & 0.4 & 0.3 \end{bmatrix}$  and the initial distribution is

$$P^{(0)} = (0.7 \ 0.2 \ 0.1).$$

Find (i)  $P(X_2 = 3)$  and (ii)  $P[X_3 = 2, X_2 = 3, X_1 = 3, X_0 = 2]$

#### Solution

Given  $P^{(0)} = (0.7 \ 0.2 \ 0.1).$

$$\Rightarrow P[X_0 = 1] = 0.7$$

$$P(X_0 = 2) = 0.2$$

$$P[X_0 = 3] = 0.1$$

$$\begin{aligned}
 P &= \begin{bmatrix} 0.1 & 0.5 & 0.4 \\ 0.6 & 0.2 & 0.2 \\ 0.3 & 0.4 & 0.3 \end{bmatrix} \\
 &= \begin{bmatrix} P_{11}^{(1)} & P_{12}^{(1)} & P_{13}^{(1)} \\ P_{21}^{(1)} & P_{22}^{(1)} & P_{23}^{(1)} \\ P_{31}^{(1)} & P_{32}^{(1)} & P_{33}^{(1)} \end{bmatrix} \\
 P^2 &= P \cdot P \\
 &= \begin{bmatrix} 0.43 & 0.31 & 0.26 \\ 0.24 & 0.42 & 0.34 \\ 0.36 & 0.35 & 0.29 \end{bmatrix} \\
 &= \begin{bmatrix} P_{11}^{(2)} & P_{12}^{(2)} & P_{13}^{(2)} \\ P_{21}^{(2)} & P_{22}^{(2)} & P_{23}^{(2)} \\ P_{31}^{(2)} & P_{32}^{(2)} & P_{33}^{(2)} \end{bmatrix}
 \end{aligned}$$

$$\begin{aligned}
 \text{(i) } P[X_2 = 3] &= \sum_{i=1}^3 P[X_2 = 3 / X_0 = i] P[\lambda_0 = i] \\
 &= P[X_2 = 3 / X_0 = 1] P[X_0 = 1] + P[X_2 = 3 / X_0 = 2] P[X_0 = 2] +
 \end{aligned}$$

$$\begin{aligned}
 &P[X_2 = 3 / X_{0=3}] P[X_0 = 3] \\
 &= P_{13}^{(2)} P[X_0 = 1] + P_{23}^{(2)} P[X_0 = 2] + P_{33}^{(2)} P[X_0 = 3] \\
 &= (0.26)(0.7) + (0.34)(0.2) + (0.29)(0.1) \\
 &= 0.279
 \end{aligned}$$

$$\begin{aligned}
 \text{(ii) } P[X_3 = 2, X_2 = 3, X_1 = 3, X_0 = 2] \\
 &= P_{32}^{(1)} P[X_2 = 3 / X_1 = 3, X_0 = 2] P[\lambda_1 = 3, X_0 = 2] \\
 &= P_{32}^{(1)} P_{33}^{(1)} P_{23}^{(1)} P[X_0 = 2] \\
 &= (0.4)(0.3)(0.2)(0.2) \\
 &= 0.0048
 \end{aligned}$$

## UNIT - IV

### QUEUEING THEORY

#### 4.1 The input (or Arrival Pattern)

##### (a) Basic Queueing Process:

Since the customers arrive in a random fashion. Therefore their arrival pattern can be described in terms of Prob. We assume that they arrive according to a Poisson Process i.e., the no of units arriving until any specific time has a Poisson distribution. This is the case where arrivals to the queueing systems occur at random, but at a certain average rate.

##### (b) Queue (or) Waiting Line

##### (c) Queue Discipline

It refers to the manner in which the members in a queue are chosen for service

##### Example:

- i. First Come First Served (FIFS)  
(or)  
First In First Out (FIFO)
- ii. Last Come, First Served (LCFS)
- iii. Service In Random Order (SIRO)
- iv. General Service Discipline (GD)

#### 4.1.1 TRANSIENT STATE

A Queueing system is said to be in transient state when its operating characteristics are dependent on time. A queueing system is in transient system when the Prob. distribution of arrivals waiting time & servicing time of the customers are dependent.

#### 4.1.2 STEADY STATE:

If the operating characteristics become independent of time, the queueing system is said to be in a steady state. Thus a queueing system acquires steady state, when the Prob. distribution of arrivals are independent of time. This state occurs in the long run of the system.

#### 4.2.3 TYPES OF QUEUEING MODELS

There are several types of queueing models. Some of them are

1. Single Queue - Single Server Point
2. Multiple Queue - Multiple Server Point
3. Simple Queue - Multiple Server Point
4. Multiple Queue - Single Server Point

The most common case of queueing models is the single channel waiting line.

##### Note

$P$  = Traffic intensity or utilization factor which represents the proportion of time the servers are busy =  $\lambda/\mu$ .

### Characteristics of Model I

1) Expected no. of customers in the system is given by

$$\begin{aligned} L_s \text{ (or) } E(n) &= \frac{\rho}{1-\rho} \\ &= \frac{\lambda}{\mu - \lambda} \end{aligned}$$

2) Expected (or avg) queue length (or) expected no. of customer waiting in the queue is given by

$$L_q = \frac{\lambda^2}{\mu(\mu - \lambda)}$$

3) Expected (or avg.) waiting time of customer in the queue is given by

$$W_q = \frac{L_q}{\lambda}$$

4) Expected (or avg.) waiting time of customer in the system (waiting & service) is given by

$$W_s = \frac{L_s}{\lambda}$$

5) Expected (or avg.) waiting time in the queue for busy system

$$W_b = \frac{\text{Expected waiting time of a customer in the queue}}{\text{Prob. (System being busy)}}$$

(or)

$$W_b = \frac{1}{\mu - \lambda}$$

6) Prob. Of  $k$  or more customers in the system

$$P(n \geq k) = \left(\frac{\lambda}{\mu}\right)^k ; \quad P(n > k) = \left(\frac{\lambda}{\mu}\right)^{k-1}$$

7) The variance (fluction) of queue length

$$\text{Var}(n) = \frac{\lambda\mu}{(\mu - \lambda)^2}$$

8) Expected no. of customers served per busy

$$\text{Period } L_b = \frac{\mu}{\mu - \lambda}$$

9) Prob. Of arrivals during the service time of any given customer

$$P[X = r] = \left(\frac{\lambda}{\lambda + \mu}\right)^r \left(\frac{\mu}{\lambda + \mu}\right)$$

10) Prob. Density function of waiting time (excluding service) distribution

$$= \lambda \left(1 - \frac{\lambda}{\mu}\right) e^{-(\mu+\lambda)t}$$

11) Prob. Density function of waiting + service time distribution

$$= (\mu - \lambda) e^{-(\mu-\lambda)t}$$

12) Prob. Of queue length being greater than or equal to n

$$= \left(\frac{\lambda}{\mu}\right)^n$$

13) Avg waiting time in non-empty queue (avg waiting time of an arrival who waits)

$$W_n = \frac{1}{\mu - \lambda}$$

14) Avg length of non-empty queue

$$(\text{Length of queue that is formed from time to time}) = L_n = \frac{\mu}{\mu - \lambda}$$

### 4.3 Littles' Formulae

We observe that  $L_s = \lambda W_s$ ,  $L_q = \lambda W_q$  &  $W_s = W_q + \frac{1}{\mu}$  and these are called

Little's Formulae

#### 4.3.1 Model I: (M/M/1) (∞/FCFS)

A TV repairman finds that the time spent on his job has an exponential distribution with mean 30 minutes. If the repair sets in the order in which they came in and if the arrival of sets is approximately Poisson with an avg. rate of 10 per 8 hours day, what is the repairman's expected idle time each day? How many jobs are ahead of avg. set just brought?

It is (M/M/1): (∞/FSFC) Problem

$$\text{Here } \lambda = \frac{10}{8 \times 60} = \frac{1}{48} \text{ set / minute and}$$

$$\mu = \frac{1}{30} \text{ set / minute}$$

$$\text{Prob. that there is no unit in the system } P_0 = 1 - \frac{\lambda}{\mu}$$

$$= 1 - \frac{5}{8} = \frac{3}{8}$$

Repairman's expected idle time in 8 hours day

$$= nP_0 = 8 \times \frac{3}{8} = 3 \text{ hours}$$

Expected avg. no. of jobs (or) Avg. no. of TV sets in the system.

$$L_s = \frac{\lambda}{\mu - \lambda}$$

$$= \frac{1/48}{1/30 - 1/48} = 5/3 \text{ jobs}$$

**Example:4.31**

In a railway marshalling yard, goods trains arrive at a rate of 30 trains per day. Assuming that the inter-arrival time follows an exponential distribution and the service time (tie time taken to hump to train) distribution is also exponential with an avg. of 36 minutes. Calculate

- (i) Expected queue size (line length)  
(ii) Prob. that the queue size exceeds 10.

If the input of trains increase to an avg. of 33 per day, what will be the change in

- (i) & (ii)

$$\lambda = \frac{30}{60 \times 24} = \frac{1}{48} \text{ trains per minute.}$$

$$\mu = \frac{1}{36} \text{ trains per minute.}$$

The traffic intensity  $\rho = \frac{\lambda}{\mu}$   
 $= 0.75$

- (i) Expected queue size (line length)

$$L_s = \frac{\lambda}{\lambda - \mu} \quad \text{or} \quad \frac{\rho}{1 - \rho}$$

$$= \frac{0.75}{1 - 0.75} = 3 \text{ trains}$$

- (ii) Prob. that the queue size exceeds 10

$$P[n \geq 10] = \rho^{10} = (0.75)^{10} = 0.06$$

Now, if the input increases to 33 trains per day, then we have

$$\lambda = \frac{30}{60 \times 24} = \frac{1}{48} \text{ trains per minute.}$$

$$\mu = \frac{1}{36} \text{ trains per minute.}$$

The traffic intensity  $\rho = \frac{\lambda}{\mu} = \frac{11}{480} \times 36$   
 $= 0.83$

Hence, recalculating the value for (i) & (ii)

(i)  $L_s = \frac{\rho}{1 - \rho} = 5 \text{ trains (approx)}$

(ii)  $P(n \geq 10) = \rho^{10} = (0.83)^{10} = 0.2 \text{ (approx)}$

Hence recalculating the values for (i) & (ii)

- (i)  $L_s = \rho / (1-\rho) = 5$  trains (approx)  
(ii)  $P(n \geq 10) = \rho^{10} = (0.83)^{10} = 0.2$  (approx)

### Example:4.3.2

(3) A super market has a single cashier. During the peak hours, customers arrive at a rate of 20 customers per hour. The average no of customers that can be processed by the cashier is 24 per hour. Find

- (i) The probability that the cashier is idle.  
(ii) The average no of customers in the queue system  
(iii) The average time a customer spends in the system.  
(iv) The average time a customer spends in queue.  
(v) The any time a customer spends in the queue waiting for service

$$\lambda = 20 \text{ customers}$$

$$\mu = 24 \text{ customers / hour}$$

- (i) Prob. That the customer is idle =  $1 - \lambda/\mu = 0.167$   
(ii) Average no of customers in the system.

$$L_s = \lambda / (\mu - \lambda) = 5$$

- (iii) Average time a customer spends in the system

$$W_s = L_s / \lambda = 1/4 \text{ hour} = 15 \text{ minutes.}$$

- (iv) Average no of customers waiting in the queue

$$L_q = \lambda^2 / (\mu(\mu - \lambda)) = 4.167$$

- (v) Average time a customer spends in the queue

$$W_q = \lambda / (\mu(\mu - \lambda)) = 12.5 \text{ minutes}$$

### 4.4 Model (IV) : (M/M/I) : (N/FCFS)

Single server finite queue model

$$1-p$$

$$P_0 = \frac{1-p}{1-p^{N+1}}$$

$$\text{Where } p \neq 1, \rho = \lambda / \mu < 1$$

$$1-p^{N+1}$$

$$\begin{aligned}
 & \left[ \begin{array}{l} (1-\rho) \\ p^n, \quad 0 \leq n \leq N, \rho \neq 1 (\lambda \neq \mu) \\ (1-\rho^{N+1}) \\ P_n = 1 \\ \hline \end{array} \right. \\
 & \qquad \qquad \qquad \frac{\qquad}{N+1}, \quad \rho = 1 \quad (\lambda = \mu)
 \end{aligned}$$

**4.4.3 CHARACTERISTIC OF MODEL IV**

(1) Average no of customers in the system

$$L_s = \frac{\lambda}{\mu - \lambda} - \frac{(N+1) (\lambda/\mu)^{N+1}}{1 - (\lambda/\mu)^{N+1}}, \quad \text{if } \lambda \neq \mu$$

$$\text{and } L_s = \sum_{n=0}^K \frac{W_n}{K+1} = \frac{K}{2}, \quad \text{if } \lambda = \mu$$

(2) Average no of customers in the queue

$$\begin{aligned}
 L_q &= L_s - (1 - p_0) \\
 L_q &= L_s - \lambda / \mu, \quad \text{where } \lambda' = \mu(1 - p_0)
 \end{aligned}$$

(3) Average waiting times in the system and in the queue

$$W_s = L_s / \lambda' \quad \& \quad W_q = L_q / \lambda', \quad \lambda' = \mu(1 - \rho_0)$$

(4) Consider a single server queuing system with Poisson input, exponential service times, suppose the mean arrival rate is 3 calling units per hour, the expected service time is 0.25 hours and the maximum permissible no calling units in the system is two. Find the steady state

probability distribution of the no of calling units in the system and the expected no of calling units in the system.

$$\lambda = 3 \text{ units per hour}$$

$$\lambda = 4 \text{ units per hour \& } N = 2$$

$$\text{The traffic intensity } \rho = \lambda/\mu = 0.75$$

$$(1 - \rho)\rho^n$$

$$P_n = \frac{(1 - \rho)\rho^n}{1 - \rho^{N+1}}, \rho \neq 1$$

$$1 - \rho^{N+1}$$

$$= (0.43) (0.75)^n$$

$$1 - \rho \quad 1 - 0.75$$

$$P_0 = \frac{1 - \rho}{1 - \rho^{N+1}}, = \frac{1 - 0.75}{(1 - 0.75)^{2+1}} = 0.431$$

$$1 - \rho^{N+1} \quad (1 - 0.75)^{2+1}$$

The expected no of calling units in the system is equation by

$$W$$

$$L_s = \sum_{n=1}^{\infty} n P_n = 0.81$$

$$n = 1$$

(2) Trains arrive at the yard every 15 minutes and the services time is 33 minutes. If the line capacity of the yard is limited to 5 trains, find the probability that yard is empty and the average no of trains in the system.

$$\lambda = 1/15 \text{ per minute; } \mu = 1/33 \text{ per minutes}$$

$$\rho = \lambda / \mu = 2.2$$

Probability that the yard is empty

$$P_0 = \frac{\rho - 1}{\rho^{N+1} - 1} = \frac{2.2 - 1}{(2.2)^6 - 1} = 1.068\% = 0.01068$$

Average no of trains in the system

$$\begin{aligned} L_s &= \sum_{n=0}^{\infty} nP_n = P_1 + 2P_2 + 3P_3 + 4P_4 + 5P_5 \\ &= P_0 [\rho + 2\rho^2 + 3\rho^3 + 4\rho^4 + 5\rho^5] \\ &= 4.22 \end{aligned}$$

#### 4.5 MULTIPLE – CHANNEL QUEUEING MODELS

Model V (M / M / C) : (∞ / FCFS)

(Multiple Servers, Unlimited Queue Model)

(M/M/C) (∞/FCFS) Model

$$P_0 = \left[ \sum_{n=0}^{C-1} \frac{1}{n!} \left( \frac{\lambda}{\mu} \right)^n + \frac{1}{C!} \left( \frac{\lambda}{\mu} \right)^n \left( \frac{\lambda C}{\mu C - \lambda} \right) \right]^{-1}$$

Characteristic of this model : (M/M/C) : (∞/FCFS)

(1)  $P[n \geq C]$  = Probability that an arrival has to wait (busy period)

$$= \sum_{n=1}^{\infty} P_n = \frac{(\lambda / \mu)^C \mu_c}{C!(C\mu - \lambda)} P_0$$

(2) Probability that an arrival enters the service without wait

$$1 - \frac{C\mu(\lambda / \mu)^C}{C!(C\mu - \lambda)} P_0$$

(3) Average queue length (or) expected no of customers waiting in the queue is

$$L_q = \left[ \frac{1}{(C-1)!} (\lambda / \mu)^C \frac{\lambda \mu}{(C\mu - \lambda)^2} \right] P_0$$

(4) Expected no of customers in the system is

$$L_s = L_q + \frac{\lambda}{\mu}; L_s = \left[ \frac{1}{(C-1)!} (\lambda/\mu)^C \frac{\lambda\mu}{(C\mu - \lambda)^2} \right] P_0 + \frac{\lambda}{\mu}$$

(5) Average time an arrival spends in the system

$$W_s = \frac{L_s}{\mu}; = \frac{\mu(\lambda/\mu)^C}{(C-1)!(C\mu - \lambda)^2} P_0 + \frac{1}{\mu}$$

(6) Average waiting time of an arrival (expected no of customer spends in the queue for service)

$$W_q = \frac{L_q}{\lambda}; W_s = \frac{1}{\mu} = \frac{\mu(\lambda/\mu)^C}{(C-1)!(C\mu - \lambda)^2} P_0$$

(7) Utilization rate  $\rho = \lambda / C\mu$

(8) The probability there are no customers or units in the system is  $P_0$

$$\text{i.e. } P_0 = \left[ \sum_{n=0}^{C-1} \frac{1}{n!} (\lambda/\mu)^n + \frac{1}{C!} (\lambda/\mu)^C \frac{C\mu}{(C\mu - \lambda)} \right]^{-1}$$

(9) The probability that there are n units in the system

$$P_n = \begin{cases} \frac{\left(\frac{\lambda}{\mu}\right)^n P_0}{n!} & \text{if } n < C \\ \frac{\left(\frac{\lambda}{\mu}\right)^n P_0}{C!C^{n-C}} & \text{if } n \geq C \end{cases}$$

### Example:4.5.1

(1) A super market has 2 girls running up sales at the counters. If the service time for each customer is exponential with mean 4 minutes and if people arrive in Poisson fashion at the rate of 10 an hour.

(a) What is the probability of having to wait for service ?

(b) What is the expected percentage of idle time for each girl.

(c) If the customer has to wait, what is the expected length of his waiting time.

$C = 2$ ,  $\lambda = 1/6$  per minute  $\mu = 1/4$  per minute  $\lambda / C\mu = 1/3$ .

$$P_0 = \left[ \sum_{n=0}^{C-1} \frac{1}{n!} (\lambda / \mu)^n + \frac{1}{C!} (\lambda / \mu)^C \frac{C\mu}{C\mu - \lambda} \right]^{-1}$$

$$= \left[ \sum_{n=0}^{C-1} \frac{1}{n!} (2/3)^n + \frac{1}{2!} (2/3)^2 \frac{2 \times 1/4}{2 \times 1/4 - 1/6} \right]^{-1}$$

$$= \left[ \{1 + 2/3\} + 1/3 \right]^{-1} = 2^{-1} = 1/2$$

$\therefore P_0 = 1/2$  &  $P_1 = (\lambda/\mu) P_0 = 1/3$

a)

$$P[n \geq 2] = \sum_{n=2}^{\infty} P_n$$

$$= \frac{(\lambda / \mu)^C \mu_C}{C!(C\mu - \lambda)} P_0 \quad \text{where } C = 2$$

$$= \frac{(2/3)^2 (1/2)}{2!(1/2 - 1/6)} (1/2) = 0.167$$

$\therefore$  Probability of having to wait for service = 0.167

b) Expand idle time for each girl  $= 1 - \lambda/C\mu$

$$= 1 - 1/3 = 2/3 = 0.67 = 67\%$$

Expected length of customers waiting time

$$\frac{1}{C\mu - \lambda} = 3 \text{ min utes}$$

### Example:4.5.2

There are 3 typists in an office. Each typist can type an average of 6 letters per hour. If letters arrive for being typed at the rate of 15 letters per hour, what fraction of time all the typists will be busy ? what is the average no of letters waiting to be typed ?

Here  $C = 3$ ;  $\lambda = 15$  per hour;  $\mu = 6$  per hour

$$P[\text{all the 3 typists busy}] = p[n \geq m]$$

Where n = no. of customer in the system

$$P[n \geq C] = \frac{(\lambda / \mu)^C C \mu}{C![(\mu - \lambda)]} P_0$$

$$= \left[ 1 + 2.5 + \frac{(2.5)^2}{2!} + \frac{1}{3!} (2.5)^3 \left[ \frac{18}{18-15} \right] \right]^{-1}$$

$$= 0.0449$$

$$P[x \geq 3] = \frac{(2.5)^3 (18)}{3! (18-15)} (0.0449)$$

$$= 0.7016$$

Average no of letters waiting to be typed

$$L_q = \left[ \frac{1}{(C-1)!} \left( \frac{\lambda}{\mu} \right)^C \frac{\lambda \mu}{(C\mu - \lambda)^2} \right] P_0$$

$$= \left[ \frac{(2.5)^3 90}{2!(18-15)^2} \right] (0.0449)$$

$$= 3.5078$$

#### 4.6 Model VI : (M/M/C) : (N / FCFS)

**(Multiple Server, Limited Curved Model)**

$$P_0 = \left[ \sum_{n=0}^{C-1} \frac{1}{n!} \left( \frac{\lambda}{\mu} \right)^n + \frac{1}{C!} \left( \frac{\lambda}{\mu} \right)^n \left( \frac{\lambda C}{\mu C - \lambda} \right) \right]^{-1}$$

##### 4.6.1 Characteristics of the model

(1) Expected or average no. of customers in the queue

$$L_q = P_0 (\lambda / \mu)^C \frac{P}{C!(1-P)^2} \quad [1 - \rho^{N-C} - (1-\rho)(N-C)\rho^{N-C}]$$

$$\text{Where} \quad \rho = \lambda / C\mu$$

(2) Expected no of customers in the system

$$L_s = L_q + C - P_0 \sum_{n=0}^{C-1} \frac{C-n}{n!} (\lambda / \mu)^n$$

$$L_s = L_q + \frac{\lambda}{\mu}$$

$$\text{Where } \lambda' = \mu \left[ C \sum_{n=0}^{C-1} (C-n) P_n \right]$$

(3) Expected waiting time in the system

$$W_q = W_s - \frac{1}{\mu} \quad (\text{or})$$

$$W_q = \frac{L_q}{\lambda'} \quad \text{Where } \lambda' = \mu \left[ C - \sum_{n=0}^{C-1} (C-n) P_n \right]$$

(4) Expected waiting time in the queue

$$W_q = W_s - \frac{1}{\mu} \quad (\text{or})$$

$$W_q = \frac{L_q}{\lambda'} \quad \text{Where } \lambda' = \mu \left[ C - \sum_{n=0}^{C-1} (C-n) P_n \right]$$

**Example:4.6.1** A car service station has two bays where service can be offered simultaneously. Due to space limitation, only four cars are accepted for servicing. The arrival pattern is poisson with a mean of one car every minute during the peak hours. The service time is exponential with mean 6 minutes. Find the average no of cars in the system during peak hours, the average waiting time of a car and the average no of cars per hour that cannot enter the station because of full capacity.

$\lambda = 1$  car per minutes

$\mu = 1/6$  per minute

$C = 3, N = 7, \rho = \lambda / C\mu = 2$

$$P_0 = \left[ \sum_{n=0}^{3-1} \frac{6^n}{n!} + \sum_{n=3}^7 \frac{1 \times 6^n}{3^{n-3}(3!)} \right]^{-1} = \frac{1}{1141}$$

(i) Expected no of customers in the queue

$$\begin{aligned} L_q &= \frac{(C\rho)^C \rho P_0}{C!(1-\rho)^2} \left[ 1 - \rho^{N-C+1} - (1-\rho)(N-C+1)\rho^{N-C} \right] \\ &= \frac{6^3 \times 2}{3!(-1)^2} \left( \frac{1}{1141} \right) \left[ 1 - 2^5 + 5(2)^4 \right] \\ &= 3.09 \text{ Cars} \end{aligned}$$

(ii) Expected cars in the system

$$\begin{aligned} L_s &= 3.09 + 3 - P_0 \sum_{n=0}^2 \frac{(2-n)}{n!} (6^n) \\ &= 0.06 \text{ Cars} \end{aligned}$$

(iii) Expected waiting time of a car in the system

$$W_s = \frac{6.06}{1(1-p_7)} = \frac{0.66}{1 - \frac{67}{3!3^4} \times \frac{1}{1141}} = 12.3 \text{ minutes}$$

Since

$$P_n = \frac{1}{C!C^{n-c}} (\lambda / \mu)^n P_0, \quad C \leq n \leq N$$

(iv) Expected no of cars per hour at that cannot enter the station.

$$60\lambda P_N = 60, P_7 = \frac{6067}{3!3^4} \left( \frac{1}{1141} \right)$$

$$= 30.4 \text{ cars per hour}$$

**Example:4.6.2** A barber shop has two barbers and three chairs for customers. Assume that customers arrive in a poisson fashion at a rate of 5 per hour and that each barber services customers according to an exponential distribution with mean of 15 minutes. Further if a customer arrives and there are no empty chairs in the shop, he will leave. What is the probability that the shop is empty ? What is the expected no of customers in the shop ?

Here  $C = 2, N = 3,$

$\lambda = 5/60 = 1/12$  customer / minute,  $\mu = 1/15$  customers / minute

$$\begin{aligned} P_0 &= \left[ \sum_{n=0}^{2-1} \frac{1}{n!} \left( \frac{\lambda}{\mu} \right)^n + \sum_{n=2}^3 \frac{1}{2^{n-2} (2!)} \left( \frac{\lambda}{\mu} \right)^n \right]^{-1} \\ &= \left[ 1 + \frac{1}{1!} \left( \frac{5}{4} \right) + \frac{1}{2!} \left( \frac{5}{4} \right)^2 + \frac{1}{4} \left( \frac{5}{4} \right)^3 \right]^{-1} \\ &= \left[ 1 + \frac{5}{4} + \frac{25}{32} + \frac{125}{256} \right]^{-1} = 0.28 \end{aligned}$$

Probability that the shop is empty = probability that there are no customers in the system

$$P_0 = 0.28$$

Probability that there are n units in the system

$$P_n = \begin{cases} \frac{1}{n!} \left( \frac{\lambda}{\mu} \right)^n P_0; & 0 \leq n \leq C \\ \frac{1}{C! C^{n-C}} \left( \frac{\lambda}{\mu} \right)^n P_0; & C \leq n \leq N \end{cases}$$

$$\therefore P_n = \begin{cases} \frac{1}{n!} \left( \frac{5}{4} \right)^n (0.28); & 0 \leq n \leq 2 \\ \frac{1}{2! 2^{n-2}} \left( \frac{5}{4} \right)^n (0.28); & 2 \leq n \leq 3 \end{cases}$$

The expected no of customers in the shop

$$\begin{aligned}
L_s &= L_q + C - P_0 \sum_{n=0}^{C-1} \frac{(C-n) \left(\frac{\lambda}{\mu}\right)^n}{n!} \\
&= \sum_{n=2}^3 (n-2)P_n + 2 - P_0 \sum_{n=0}^{2-1} \frac{(2-n) \left(\frac{5}{4}\right)^n}{n!} \\
&= P_3 + 2 - (3.25)P_0 \\
&= \frac{(1.25)^3(0.28)}{4} + 2 - (3.25)(0.28) \\
&= 1.227 \text{ Customers (approx)}
\end{aligned}$$

#### 4.7 Finite Source Models

Single-channel finite population model with Poisson arrivals and exponential service (M/M/1)(FCFS/n/M).

Characteristics of Finite Source Model (M/M/1) : FCFS/n/M

(1) Probability that the system is idle

$$P_0 = \left[ \sum_{n=0}^M \frac{M!}{(M-n)!} \left(\frac{\lambda}{\mu}\right)^n \right]^{-1}$$

(2) Probability that there are n customers in the system

$$P_n = \frac{M!}{(M-n)!} \left(\frac{\lambda}{\mu}\right)^n P_0, \quad n = 0, 1, 2, \dots, M$$

(3) Expected no of customers in the queue (or queue length)

$$L_q = M - \left(\frac{\lambda + \mu}{\lambda}\right)(1 - P_0)$$

(4) Expected no of customers in the system

$$L_s = M - \frac{\mu}{\lambda}(1 - P_0)$$

(5) Expected waiting time of a customer in the queue

$$W_q = \frac{L_q}{\mu(1-P_0)}$$

(6) Expected waiting time of a customer in the system

$$W_s = W_q + \frac{1}{\mu}$$

**Example:4.7.1.** A mechanic repairs machines. The mean time b/w service requirements is 5 hours for each machine and forms an exponential distribution. The mean repair time is C hour and also follows the same distribution pattern.

- (i) Probability that the service facility will be idle
- (ii) Probability of various no of machines (0 through 4) to be and being repaired
- (iii) Expected no of machines waiting to be repaired and being repaired
- (iv) Expected time a machine will wait in queue to be repaired.

$\lambda = 1/5 = 0.2$  Machine / hours

$\mu = 1$  Machine / hour,  $\mu = 4$  Machines

$\rho = \lambda/\mu = 0.2$

- (i) Probability that the system shall be idle (or empty) is

$$\begin{aligned}
P_0 &= \left[ \sum_{n=0}^M \frac{M!}{(M-n)!} \left( \frac{\lambda}{\mu} \right)^n \right]^{-1} \\
&= \left[ \sum_{n=0}^4 \frac{4!}{(4-n)!} (0.2)^n \right]^{-1} \\
&= \left[ 1 + \frac{4!}{3!} (0.2) + \frac{4!}{2!} (0.2)^2 + \frac{4!}{1!} (0.2)^3 + \frac{4!}{0!} (0.2)^4 \right]^{-1} \\
&= [1 + 0.8 + 0.48 + 0.192 + 0.000384]^{-1} \\
&= (2.481)^{-1} = 0.4030
\end{aligned}$$

(ii) Probability that there shall be various no of machines (0 through 5) in the system is obtained by using the formula

$$P_n = \frac{M!}{(M-n)!} \left( \frac{\lambda}{\mu} \right)^n P_0, \quad n \leq M$$

$$P_0 = 0.4030$$

$$P_1 = \frac{4!}{3!} (0.2)(0.4030) = 0.3224$$

$$P_2 = \frac{4!}{2!} (0.2)^2 P_0 = 0.1934$$

$$P_3 = \frac{4!}{1!} (0.2)^3 P_0 = 0.0765$$

$$P_4 = 4!(0.2)^4 P_0 = 0$$

(iii) The expected no of machines to be and being repaired (in the system)

$$\begin{aligned}
 L_s &= M - \frac{\mu}{\lambda}(1 - P_0) \\
 &= 4 - \frac{1}{0.2}(1 - 0.403) \\
 &= 1.015 \text{ min utes}
 \end{aligned}$$

(iv) Expected time the machine will wait in the queue to be repaired

$$\begin{aligned}
 W_q &= \frac{1}{\mu} \left[ \frac{\mu}{1 - P_0} - \frac{\lambda + \mu}{\lambda} \right] \\
 &= \frac{4}{0.597} - 6 \\
 &= 0.70 \text{ hours (or) 42 min utes}
 \end{aligned}$$

**Example:4.7.2.** Automatic car wash facility operates with only one bay cars arrive according to a poisson is busy. If the service time follows normal distribution with mean 12 minutes and S.D 3 minutes, find the average no of cars waiting in the parking lot. Also find the mean waiting time of cars in the parking lot.

$$A = 1/15, E(T) = 12 \text{ min}, V(T) = 9 \text{ min},$$

$$\mu = \frac{1}{E(T)} = \frac{1}{12}$$

By P-K formula

$$\begin{aligned}
 E(N_s) = L_s &= E(T) + \frac{\lambda^2 [V(T) + E^2(T)]}{2 - [1 - \lambda E(T)]} \\
 &= \frac{12}{15} + \frac{\frac{1}{225}(9 + 144)}{2(1 - \frac{12}{15})} \\
 &= \frac{4}{5} + \frac{153}{90} = 2.5 \text{ Cars}
 \end{aligned}$$

By Little's formula

$$E(N_q) = L_q = L_s - \frac{\lambda}{\mu}$$

$$L_q = 2.5 - \frac{12}{15}$$

$$= 1.7 \text{ cars}$$

$\therefore$  The average no of cars waiting in the parking lot = 1.7 cars

The mean waiting time of the cars in the parking lot

$$W_q = \frac{L_q}{\lambda} = \frac{1.7}{1/15} = 25.5 \text{ minutes}$$

$$\text{(or) } 0.425 \text{ hour}$$

### TUTORIAL PROBLEMS

1. The local one-person barber shop can accommodate a maximum of 5 people at a time (4 waiting and 1 getting hair cut). Customers arrive according to a Poisson distribution with mean 5 per hour. The barber cuts hair at an average rate of 1 per hour (service time).

- What percentage of time is the barber idle?
- What fraction of the potential customers are turned away? (c) What is the expected number of customers waiting for a hair cut?
- How much time can a customer expect to spend in the barber shop?

2. A bank has two tellers working on savings accounts. The first teller handles withdrawal only. The second teller handles deposits only. It has been found that the service time of a customer. Depositors are found to arrive in a Poisson fashion throughout the day with mean arrival rate of 16 per hour.

Withdrawers also arrive in a Poisson fashion with mean arrival rate of 14 per hour. What would be the effect on the number of customers if each teller could handle both withdrawals and deposits. What would be the effect, if this could only be accounted for a time of 3.5 min.?

3. Customers arrive at a one-man barber shop according to a Poisson process with mean interarrival time of 12 min and 10 min in the barber's chair.

(a) What is the expected number of customers in the barber shop and in the queue?

(b) Calculate the percentage of time an arrival can walk straight into the barber's chair without having to wait.

(c) How much time can a customer expect to spend in the barber's shop?

(e) Management will provide another chair and hire another barber, when a customer's waiting time in the shop exceeds 1.25 h. How much must the average rate of arrivals increase to warrant a second barber?

(f) What is the probability that the waiting time in the system is greater than 30 min?

4. A 2-person barber shop has 5 chairs to accommodate waiting customers. Potential customers, who arrive without entering the barber shop. Customers arrive at the average rate of 4 per hour and spend an average of 12 min in the shop. Find  $P_0, P_1, P_7, E(N_q)$  and  $E(W)$ .

5. Derive the difference equations for a Poisson queue system in the steady state.

6. There are 3 typists in an office. Each typist can type an average of 6 letters per hour. If letters arrive for being typed at a rate of 12 per hour.

1. What fraction of the time all the typists will be busy?

2. What is the average number of letters waiting to be typed?

3. What is the average time a letter has to spend for waiting and for being typed?

4. What is the probability that a letter will take longer than 20 min. waiting to be typed and being typed?

7. Determine the steady state probabilities for M/M/C queueing system.

### WORKED OUT EXAMPLE

**Example 1:** A super market has 2 girls running up sales at the counters. If the service time for each customer is 1/4 minutes and if people arrive in Poisson fashion at the rate of 10 an hour.

- (a) What is the probability of having to wait for service ?
- (b) What is the expected percentage of idle time for each girl.
- (c) If the customer has to wait, what is the expected length of his waiting time.

$C = 2$ ,  $\lambda = 1/6$  per minute  $\mu = 1/4$  per minute  $\lambda / C\mu = 1/3$ .

$$P_0 = \left[ \sum_{n=0}^{C-1} \frac{1}{n!} (\lambda / \mu)^n + \frac{1}{C!} (\lambda / \mu)^C \frac{C\mu}{C\mu - \lambda} \right]^{-1}$$

$$= \left[ \sum_{n=0}^{C-1} \frac{1}{n!} (2/3)^n + \frac{1}{2!} (2/3)^2 \frac{2 \times 1/4}{2 \times 1/4 - 1/6} \right]^{-1}$$

$$= \left[ \{1 + 2/3\} + 1/3 \right]^{-1} = 2^{-1} = 1/2$$

$$\therefore P_0 = 1/2 \text{ \& } P_1 = (\lambda/\mu) P_0 = 1/3$$

a)

$$P[n \geq 2] = \sum_{n=2}^{\infty} P_n$$

$$= \frac{(\lambda / \mu)^C \mu_C}{C!(C\mu - \lambda)} P_0 \quad \text{where } C = 2$$

$$= \frac{(2/3)^2 (1/2)}{2!(1/2 - 1/6)} (1/2) = 0.167$$

$\therefore$  Probability of having to wait for service = 0.167

b) Expand idle time for each girl  $= 1 - \lambda/C\mu$

$$= 1 - 1/3 = 2/3 = 0.67 = 67\%$$

Expected length of customers waiting time

$$= \frac{1}{C\mu - \lambda} = 3 \text{ minutes}$$

**Example 2:** There are 3 typists in an office. Each typist can type an average of 6 letters per hour. If letters of 15 letters per hour, what fraction of time all the typists will be busy ? what is the average no of letters waiting to

Here  $C = 3$ ;  $\lambda = 15$  per hour;  $\mu = 6$  per hour

$P[\text{all the 3 typists busy}] = p[n \geq m]$

Where  $n =$  no. of customer in the system

$$P[n \geq C] = \frac{(\lambda / \mu)^C C \mu}{C![(\mu - \lambda)]} P_0$$

$$= \left[ 1 + 2.5 + \frac{(2.5)^2}{2!} + \frac{1}{3!} (2.5)^3 \left[ \frac{18}{18-15} \right] \right]^{-1}$$

$$= 0.0449$$

$$P[x \geq 3] = \frac{(2.5)^3 (18)}{3! (18-15)} (0.0449)$$

$$= 0.7016$$

Average no of letters waiting to be typed

$$L_q = \left[ \frac{1}{(C-1)!} \left( \frac{\lambda}{\mu} \right)^C \frac{\lambda \mu}{(C\mu - \lambda)^2} \right] P_0$$

$$= \left[ \frac{(2.5)^3 90}{2!(18-15)^2} \right] (0.0449)$$

$$= 3.5078$$

## UNIT V

### ADVANCED QUEUEING MODELS

#### 5.1 Non-Markovian queues and Queue Networking The M/G/1 queueing system (M/G/1) : ( $\infty$ /GD) model Pollaczek Ishintchine Formula

Let  $N$  and  $N_1$  be the numbers of customers in the system at time  $t$  and  $t+T$ , when two consecutive customers have just left the system after getting service.

Let  $k$  be the no. of customer arriving in the system during the service time  $T$ .

$$N_1 = \begin{cases} K & \text{if } n = 0 \\ (N-1) + k & \text{if } n > 0 \end{cases}$$

Where  $k = 0, 1, 2, 3, \dots$  is the no. of arrivals during the service time ( $K$  is a discrete random variable)

$$\text{Alternatively, if } \delta = \begin{cases} 1 & \text{if } N = 0 \\ 0 & \text{if } N > 0 \end{cases}$$

$$\text{Then } N_1 = N - 1 + \delta + k.$$

Various formula for (M/G/1) : ( $\infty$ /GD)

Model can be summarized as follows:

1) Average no. of customer in the system

$$L_s = \frac{\lambda^2 \sigma^2 + \rho^2}{2(1-\rho)} + \rho \quad \text{where } \sigma^2 = V(T), P = \lambda E(T) \text{ (or) } \rho = \lambda/4$$

2) Average queue length

$$L_q = \frac{\lambda^2 \sigma^2 + \rho^2}{2(1-\rho)}$$

3) Average waiting time of a customer in the queue

$$W_q = \frac{\lambda^2 \sigma^2 + \rho^2}{2\lambda(1-\rho)}$$

4) Average waiting time of a customer spends in the system

$$W_s = \frac{\lambda^2 \sigma^2 + \rho^2}{2\lambda(1-\rho)} + \frac{1}{\mu}$$

#### Example :5.1.1

Automatic car wash facility operates with only one bay cars arrive according to a Poisson distribution with a mean of 4 cars per hour and may wait in the facility's parking lot if the bay is busy. The parking lot is large enough to accommodate any no. of cars. If the service time for all cars is constant and equal to community determine.

(1) Mean no. of customers in the system  $L_s$

(2) Mean no. of customers in the queue  $L_q$

(3) Mean waiting time of a customer in the system  $W_s$

(4) Mean waiting time of a customer in the system  $W_q$

This is (M/G/I) : ( $\infty$ /GD) model. Hence  $\lambda = 4$  cars / hour.

T is the service time & is constant equal to 10 minutes

Then  $E(T) = 10$  minutes &  $V(T) = 0$ .

$$\therefore \frac{1}{\mu} = 10 \Rightarrow \mu = \frac{1}{10} \text{ per minute}$$

$$\therefore \mu = 6 \text{ cars / hours and } \sigma^2 = \text{Var}(T) = 0$$

$$\rho = \frac{\lambda}{\mu} = \frac{4}{6} = \frac{2}{3}$$

Avg. no. of customers in the system

$$L_s = \frac{\lambda^2 \sigma^2 + \rho^2}{2(1-\rho)} + \rho = 1.333 \square 1 \text{ car .}$$

Avg. No. of customers in the queue.

$$L_q = \frac{\lambda^2 \sigma^2 + \rho^2}{2(1-\rho)} = 0.667 \text{ cars.}$$

Avg. waiting time of a customer in the system

$$W_s = \frac{L_s}{\lambda} = 0.333 \text{ hour}$$

Avg. waiting time of a customer in the queue

$$W_q = \frac{L_q}{\lambda} = 0.167 \text{ hour}$$

**Example :5.1.2** A car wash facility operates with only one day. Cars arrive according to a Poisson distribution with a mean of 4 cars per hour and may wait in the factory's parking lot in the bay is busy. The parking lot is large enough to accommodate any no. of cars. If the service time for a car has uniform distribution b/w 8 & 12 minutes, find (i) The avg. no. of cars waiting in the parking lot and (ii) The avg. waiting time of car in the parking lot.

**Solution**

$$\lambda = 4; \quad \mu = \frac{1}{15} \text{ cars / minutes}$$

$E(T) =$  Mean of the uniform distribution in (8, 12)

$$= \frac{8+12}{2} = 10 \text{ minutes} \quad \left[ \text{Mean} = \frac{a+b}{2} \right]$$

$$V(T) = \frac{1}{12}(b-a)^2 = \frac{4}{3}$$

$$\Rightarrow \mu = \frac{1}{10} \text{ cars / minutes and } \sigma^2 = \frac{4}{3}$$

$$\text{Then } \rho = \frac{\lambda}{\mu} = \frac{2}{3}$$

By  $\rho - k$  formula

$$\begin{aligned}
 L_q &= \frac{\lambda^2 \sigma^2 + \rho^2}{\lambda(1-\rho)} = \frac{1/225(4/3) + 4/9}{2(1-2/3)} \\
 &= \frac{4/3 [1/225 + 1/3]}{2/3} \\
 &= 0.675 \text{ cars}
 \end{aligned}$$

∴ The avg. no. of cars waiting in the parking lot = 0.675 crs  
 The avg. waiting time of a car in the parking lot

$$\begin{aligned}
 &= \frac{L_q}{\lambda} = 0.675 \times 15 \\
 W_q &= 10.125 \text{ minutes .}
 \end{aligned}$$

## 5.2 QUEUE NETWORKS

### Queue in series without possibility of queueing steady - state probability

$P(0, 0)$  = Prob. (that both stages are empty)

$P(1, 0)$  = Prob. (that the 1st stage is full and the second is empty)

$P(1, 1)$  = Prob. (that both the stages are full, first is working)

$P(b_1, 1)$  = Prob. (that first is blocked and the second is full)

$P(0, 1)$  = Prob. (that 1st stage is empty and the second is full)

### 5.2.1 STEADY STATE EQUATION

$$\lambda P(0, 0) = \mu_2 P(0, 1)$$

$$(\lambda + \mu_2) P(0, 1) = \mu_1 P(0, 1) + \mu_2 P(b, 1)$$

$$\mu_1 P(1, 0) = \mu_2 P(1, 1) + \lambda P(0, 0)$$

$$(\mu_1 + \mu_2) P(1, 1) = \lambda P(0, 1)$$

$$\mu_2 P(b, 1) = \mu_1 P(1, 1)$$

$$P(0, 0) + P(0, 1) + P(1, 0) + P(1, 1) + P(b, 1) = 1$$

The solution of these equation is given by

$$P(0, 0) = \lambda^2 \mu_1 (\mu_1 + \mu_2) / \sigma$$

$$P(0, 1) = \lambda \mu_1 \mu_2 (\mu_1 + \mu_2) / \sigma$$

$$P(1, 0) = \lambda \mu_2^2 (\lambda + \mu_1 + \mu_2) / \sigma$$

$$P(1, 1) = \lambda^2 \mu_1 \mu_2 / \sigma$$

$$P(b, 1) = \lambda^2 \mu_1^2 / \sigma$$

$$\text{Where } \sigma = \mu_1 (\mu_1 + \mu_2) (\lambda^2 + \lambda \mu_2 + \mu_2^2) + \lambda (\mu_1 + \mu_2 + \lambda) \mu_2^2$$

Hence the rate of loss - call is given by

$$L = P(1, 0) + P(1, 1) + P(0, 1)$$

**Example :5.2.1** A repair facility shared by a large no. of machines has two sequential stations with respective rates one per hour and two per hour. The cumulative failure rate of all machines is 0.5 per hour. Assuming that the system behaviour may be approximated by the two-stage tandem queue, determine (i) the avg repair time (ii) the prob. that both service stations are idle (iii) the station which is the bottleneck of the service facility.

**Given**

$$\lambda = 0.5 \quad \mu_0 = 1 \quad \mu_1 = 2$$

$$\rho_0 = \frac{\lambda}{\mu_0} = 0.5 \quad \& \quad \rho_1 = \frac{\lambda}{\mu_1} = 0.25$$

The average length of the queue at station  $i$  ( $i = 0, 1$ ) is given by

$$E(N_i) = \frac{\rho_i}{1 - \rho_i}$$

$$\therefore E(N_0) = 1 \quad \& \quad E(N_1) = \frac{1}{3}$$

Using Little's formula, the repair delay at the two stations is respectively given by

$$E(R_0) = \frac{E(N_0)}{\lambda} = 2 \quad \& \quad E(R_1) = \frac{E(N_1)}{\lambda} = \frac{2}{3} \text{ hours}$$

Hence the avg. repair time is given by

$$E(R) = E(R_0) + E(R_1)$$

$$= 2 + \frac{2}{3} = \frac{8}{3} \text{ hours}$$

This can be decomposed into waiting time at station 0 (=1 hour), the service time at station 0 ( $= \frac{1}{N_0} = 1$ ), the waiting time at station 1 ( $= \frac{1}{6}$  hour) and the service time at station 1 ( $\frac{1}{\mu_1} = \frac{1}{2}$  hour).

$$\text{The prob. that both service stations are idle} = P(0, 0) = (1 - \rho_0)(1 - \rho_1)$$

$$= \frac{3}{8}$$

Station 0 is the bottleneck of the repair facility since  $P_0 = 0.5$  is the largest value.

### Open Central Service Queueing Model

$$E(N_j) = \frac{\rho_j}{1 - \rho_j} \quad \text{and} \quad E(R_j) = \frac{1}{\lambda} \frac{\rho_j}{1 - \rho_j}$$

### Example :5.2.2

Consider the open central server queueing model with two I/O channels with a common service rate of  $1.2 \text{ sec}^{-1}$ . The CPU service rate is  $2 \text{ sec}^{-1}$ , the arrival rate is  $\frac{1}{7}$  jobs / second. The branching prob. are given by  $P_0 = 0.7$ ,  $P_1 = 0.3$  and  $P_2 = 0.6$ . Determine the steady state prob., assuming the service times are independent exponentially distributed random variables.

Determine the queue length distributions at each node as well as the avg. response time from the source on the sink.

We are given

$$\mu_1 = 1.2 / \text{second}$$

$$\mu_2 = 1.2 / \text{second}$$

$$\mu_0 = 2 / \text{second} \quad \& \quad \lambda = \frac{1}{7} \text{ jobs / second}$$

The branching prob. are  $P_0 = 0.7$ ,  $P_1 = 0.3$  and  $P_2 = 0.6$ .

$$\lambda_0 = \frac{\lambda}{P_0}$$

$$\lambda_0 = \frac{1/7}{0.7}$$

$$= \frac{1}{4} = \frac{10}{49}$$

$$\lambda_1 = \frac{\lambda P_1}{P_0} = \frac{1}{7} \times \frac{0.3}{0.7}$$

$$= \frac{3}{49}$$

$$\lambda_2 = \frac{\lambda P_2}{P_0} = \frac{1}{7} \times \frac{0.6}{0.7}$$

$$= \frac{6}{49}$$

The utilization  $\rho_j$  of node  $j$  is given by

$$\rho_j = \frac{\lambda_j}{\mu_j} \quad (j = 0, 1, 2)$$

$$\rho_0 = \frac{\lambda_0}{\mu_0} = \frac{5}{49}$$

$$\rho_1 = \frac{\lambda_1}{\mu_1} = \frac{5}{98}$$

$$\rho_2 = \frac{\lambda_2}{\mu_2} = \frac{5}{49}$$

The steady state prob. are given by

$$P_j(k_j) = (1 - \rho_j) \rho_j^{k_j} \text{ at node } j$$

$$P_0(k_0) = \frac{44}{49} \left( \frac{5}{49} \right)^{k_0}$$

$$P_1(k_1) = (1 - \rho_1) \rho_1^{k_1}$$

$$= \frac{93}{98} \left( \frac{5}{98} \right)^{k_1}$$

$$\begin{aligned}
 P_2(k_2) &= (1 - \rho_2) \rho_2^{k_2} \\
 &= \frac{44}{49} \left( \frac{5}{49} \right)^{k_2}
 \end{aligned}$$

The average queue length  $E(N_j)$  of node  $j$  is given by

$$E(N_j) = \frac{\rho_j}{1 - \rho_j}$$

$\therefore$  For node 0,

$$E(N_0) = \frac{\rho_0}{1 - \rho_0} = \frac{5}{44} \text{ job / second.}$$

For node 1,

$$E(N_1) = \frac{\rho_1}{1 - \rho_1} = \frac{5}{93} \text{ job / second.}$$

For node 2,

$$E(N_2) = \frac{\rho_2}{1 - \rho_2} = \frac{5}{44} \text{ job / second.}$$

The average response time from the source to the sink is given by

$$\begin{aligned}
 E(R) &= \frac{1}{\mu_0 P_0 - \lambda} + \sum_{j=1}^m \frac{1}{\frac{\mu_0 P_0 - \lambda}{\rho_j}} \\
 &= \frac{1}{1.4 - \frac{1}{7}} + \frac{1}{\frac{7}{3}(1.2) - \frac{1}{7}} + \frac{1}{\frac{7}{6}(1.2) - \frac{1}{7}} \\
 &= \frac{7}{8.8} + \frac{21}{55.8} + \frac{21}{26.4} \\
 &= 0.7954 + 0.3763 + 0.7954 \\
 &= 1.9671 \\
 &\square 1.97 \text{ seconds.}
 \end{aligned}$$

### TUTORIAL PROBLEMS

1. Derive the Balance equation of the birth and death process.
2. Derive the Pollaczek-Khinchine formula.
3. Consider a single server, poisson input queue with mean arrival rate of 10/hour currently the server works according to an exponential distribution with

mean service time of 5 minutes. Management has a training course which will result in an improvement in the variance of the service time but at a slight increase in the mean. After completion of the course, it is estimated that the mean service time will increase to 5.5 minutes but the standard deviation will decrease from 5 minutes to 4 minutes. Management would like to know; whether they should have the server undergo further training.

4. In a heavy machine shop, the overhead crane is 75% utilized. Time study observations gave the average slinging time as 10.5 minutes with a standard deviation of 8.8 minutes. What is the average call-in rate for the services of the crane and what is the average delay in getting service? If the average service time is cut to 8.0 minutes, with a standard deviation of 6.0 minutes, how much reduction will occur, on average, in the delay of getting served?

5. Automatic car wash facility operates with only one bay. Cars arrive according to a Poisson process, with a mean of 4 cars per hour and may wait in the facility's parking lot if the bay is busy. If the service time for all cars is constant and equal to 10 min, determine  $L_s$ ,  $L_q$ ,  $W_s$  and  $W_q$

### WORKED OUT EXAMPLES

**Example :1** A car wash facility operates with only one bay. Cars arrive according to a Poisson distribution with a mean of 4 cars per hour and may wait in the factory's parking lot if the bay is busy. The parking lot is large enough to accommodate any no. of cars. If the service time for a car has a uniform distribution b/w 8 & 12 minutes, find (i) The avg. no. of cars waiting in the parking lot and (ii) The avg. waiting time of car in the parking lot.

#### Solution

$$\lambda = 4; \quad \mu = \frac{1}{15} \text{ cars / minutes}$$

$E(T)$  = Mean of the uniform distribution in (8, 12)

$$= \frac{8+12}{2} = 10 \text{ minutes} \quad \left[ \text{Mean} = \frac{a+b}{2} \right]$$

$$V(T) = \frac{1}{12}(b-a)^2 = \frac{4}{3}$$

$$\Rightarrow \mu = \frac{1}{10} \text{ cars / minutes and } \sigma^2 = \frac{4}{3}$$

$$\text{Then } \rho = \frac{\lambda}{\mu} = \frac{2}{3}$$

By  $\rho - k$  formula

$$L_q = \frac{\lambda^2 \sigma^2 + \rho^2}{\lambda(1-\rho)} = \frac{\frac{1}{225} \left( \frac{4}{3} \right) + \frac{4}{9}}{2 \left( 1 - \frac{2}{3} \right)}$$

$$= \frac{4/3 \left[ \frac{1}{225} + \frac{1}{3} \right]}{2/3}$$

$$= 0.675 \text{ cars}$$

∴ The avg. no. of cars waiting in the parking lot = 0.675 cars

The avg. waiting time of a car in the parking lot

$$= \frac{L_q}{\lambda} = 0.675 \times 15$$

$$W_q = 10.125 \text{ minutes .}$$

# 2-MARKS

## Unit I Random Variable

### 1.. Define Random Variable (RV).

A random variable is a function  $X: S \rightarrow R$  that assigns a real number  $X(S)$  to every element  $s \in S$ , where  $S$  is the sample space corresponding to a random experiment  $E$ .

**Ex:** Consider an experiment of tossing an unbiased coin twice. The outcomes of the experiment are HH, HT, TH, TT. let  $X$  denote the number of heads turning up. Then  $X$  has the values 2,1,1,0. Here  $X$  is a random variable which assigns a real number to every outcome of a random experiment.

### 2. Define Discrete Random Variable.

If  $X$  is a random variable which can take a finite number or countably infinite number of values,  $X$  is called a discrete RV.

**Ex.** Let  $X$  represent the sum of the numbers on the 2 dice, when two dice are thrown.

### 3. Define Continuous Random Variable.

If  $X$  is a random variable which can take all values (i.e., infinite number of values) in an interval, then  $X$  is called a continuous RV.

**Ex.** The time taken by a lady who speaks over a telephone.

### 4. Define One-dimensional Random Variables.

If a random variable  $X$  takes on single value corresponding to each outcome of the experiment, then the random variable is called one-dimensional random variables. it is also called as scalar valued RVs.

**Ex:**

In coin tossing experiment, if we assume the random variable to be appearance of tail, then the sample space is  $\{H, T\}$  and the random variable is  $\{1, 0\}$ . which is an one-dimensional random variables.

### 5. State the Properties of expectation.

If  $X$  and  $Y$  are random variables and  $a, b$  are constants, then

1.  $E(a) = a$

Proof:

$$E(X) = \sum_{i=1}^n x_i p_i$$

$$E(a) = \sum_{i=1}^n a p_i = a \sum_{i=1}^n p_i = a(1) \quad (\because \sum_{i=1}^n p_i = 1)$$

$$E(a) = a$$

2.  $E(aX) = aE(X)$

Proof:

$$E(X) = \sum_{i=1}^n x_i p_i$$

$$E(aX) = \sum_{i=1}^n a x_i p_i = a \sum_{i=1}^n x_i p_i = aE(X)$$

3.  $E(aX+b) = aE(X)+b$

Proof:

$$E(X) = \sum_{i=1}^n x_i p_i$$

$$E(aX+b) = \sum_{i=1}^n (ax_i + b)p_i = \sum_{i=1}^n (ax_i)p_i + \sum_{i=1}^n bp_i = a \sum_{i=1}^n x_i p_i + b \sum_{i=1}^n p_i$$

$$E(aX+b) = a E(X) + b \quad \left\{ \because \sum_{i=1}^n p_i = 1 \right\}$$

4.  $E(X+Y) = E(X) + E(Y)$

5.  $E(XY) = E(X) \cdot E(Y)$ , if X and Y are random variables.

6.  $E(X - \bar{X}) = E(X) - \bar{X} = \bar{X} - \bar{X} = 0$

**6. A RV X has the following probability function**

<b>Values of X</b>	<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>	<b>8</b>
<b>P(x)</b>	<b>a</b>	<b>3a</b>	<b>5a</b>	<b>7a</b>	<b>9a</b>	<b>11a</b>	<b>13a</b>	<b>15a</b>	<b>17a</b>

1) Determine the value of a.

2) Find  $P(X < 3)$ ,  $P(X \geq 3)$ ,  $P(0 < X < 5)$ .

**Solution:**

1) We know that  $\sum_x P(x) = 1$

$$a + 3a + 5a + 7a + 9a + 11a + 13a + 15a + 17a = 1$$

$$81a = 1$$

$$a = 1/81$$

2)  $P(X < 3) = P(X=0) + P(X=1) + P(X=2)$

$$= a + 3a + 5a$$

$$= 9a = 9/81 = 1/9$$

$$P(X \geq 3) = 1 - P(X < 3) = 1 - 1/9 = 8/9$$

$$P(0 < X < 5) = P(X=1) + P(X=2) + P(X=3) + P(X=4)$$

$$= 3a + 5a + 7a + 9a = 24a = 24/81$$

**7. If X is a continuous RV whose PDF is given by**

$$f(x) = \begin{cases} c(4x - 2x^2), & 0 < x < 2 \\ 0, & \text{otherwise} \end{cases}$$

**Find c and mean of X.**

**Solution:**

We know that  $\int_{-\infty}^{\infty} f(x) dx = 1$

$$\int_0^2 c(4x - 2x^2) dx = 1$$

$$c = 3/8$$

$$E(X) = \int_{-\infty}^{\infty} xf(x) dx = \int_0^2 \frac{3}{8} x(4x - 2x^2) dx = \frac{8}{3}$$

**8. A continuous RV X that can assume any value between x = 2 and x = 5 has a density function given by  $f(x) = k(1+x)$ . Find  $P(X < 4)$ .**

**Solution:**

We know that  $\int_{-\infty}^{\infty} f(x) dx = 1$

$$\int_2^5 k(1+x) dx = 1$$

$$k = 2/27$$

$$P(X < 4) = \int_2^4 \frac{2}{27} (1+x) dx = \frac{16}{27}$$

9. A RV X has the density function

$$f(x) = \begin{cases} k \frac{1}{1+x^2}, & -\infty < x < \infty \\ 0, & \text{otherwise} \end{cases} \quad \text{Find } k.$$

**Solution:**

$$\begin{aligned} \text{We know that } \int_{-\infty}^{\infty} f(x) dx &= 1 \\ \int_{-\infty}^{\infty} k \frac{1}{1+x^2} dx &= 1 \\ k(\tan^{-1} x)_{-\infty}^{\infty} &= 1 \\ k\left(\frac{\pi}{2} + \frac{\pi}{2}\right) &= 1 \\ \therefore k &= \frac{1}{\pi} \end{aligned}$$

10. If the p.d.f of a RV .X is given by  $f(x) = \begin{cases} \frac{1}{4}, & -2 < X < 2 \\ 0, & \text{elsewhere} \end{cases}$ . Find  $P[|X| > 1]$ .

**Answer:**

$$P[|X| > 1] = 1 - P[|X| < 1] = 1 - \int_{-1}^1 \frac{1}{4} dx = 1 - \frac{1}{4}[1+1] = 1 - \frac{1}{2} = \frac{1}{2}$$

11. If the pdf of a RV X is  $f(x) = \frac{x}{2}$  in  $0 \leq x \leq 2$ , find  $P[X > 1.5 / X > 1]$

**Answer:**

$$P[X > 1.5 / X > 1] = \frac{P[X > 1.5]}{P[X > 1]} = \frac{\int_{1.5}^2 \frac{x}{2} dx}{\int_1^2 \frac{x}{2} dx} = \frac{4 - 2.25}{4 - 1} = 0.5833$$

12. Determine the Binomial distribution whose mean is 9 and whose SD is 3/2

$$\begin{aligned} \text{Ans : } np &= 9 \text{ and } npq = 9/4 \quad \therefore q = \frac{npq}{np} = \frac{1}{4} \\ \Rightarrow p &= 1 - q = \frac{3}{4} \quad . np = 9 \Rightarrow n = 9 \left(\frac{4}{3}\right) = 12. \end{aligned}$$

$$P[X = r] = 12C_r \left(\frac{3}{4}\right)^r \left(\frac{1}{4}\right)^{12-r}, \quad r = 0, 1, 2, \dots, 12.$$

13. Find the M.G.F of a Binomial distribution

$$M_x(t) = \sum_{i=0}^n e^{tx} {}_n C_x p^x q^{n-x} = \sum_{x=0}^n {}_n C_r (pe^t)^x q^{n-x} = (q + pe^t)^n$$

14. The mean and variance of the Binomial distribution are 4 and 3 respectively. Find  $P(X=0)$ .

**Ans :**

$$\text{mean} = np = 4,$$

$$\text{Variance} = npq = 3$$

$$q = \frac{3}{4}, \quad p = 1 - \frac{3}{4} = \frac{1}{4}, \quad np = 4 \Rightarrow n = 16$$

$$P(X=0) = {}_n C_0 p^0 q^{n-0} = 16 C_0 p^0 q^{16-0} = \left(\frac{1}{4}\right)^0 \left(\frac{3}{4}\right)^{16} = \left(\frac{3}{4}\right)^{16}$$

**15. For a Binomial distribution mean is 6 and standard deviation is  $\sqrt{2}$ . Find the first two terms of the distribution.**

**Ans :** Given  $np = 6$ ,  $npq = (\sqrt{2})^2 = 2$

$$q = \frac{2}{6} = \frac{1}{3}, \quad p = 1 - q = \frac{2}{3}, \quad np = 6 \Rightarrow n\left(\frac{2}{3}\right) = 6 \Rightarrow n = 9$$

$$P(X=0) = {}_n C_0 p^0 q^{n-0} = 9 C_0 \left(\frac{2}{3}\right)^0 \left(\frac{1}{3}\right)^{9-0} = \left(\frac{1}{3}\right)^9$$

$$P(X=1) = {}_n C_1 p^1 q^{n-1} = 9 \left(\frac{2}{3}\right) \left(\frac{1}{3}\right)^8 = 6 \left(\frac{1}{3}\right)^8$$

**16. The mean and variance of a binomial variate are 4 and  $\frac{4}{3}$  respectively,**

**find  $P[X \geq 1]$ .**

**Ans :**  $np = 4$ ,  $npq = \frac{4}{3} \Rightarrow q = \frac{1}{3}, p = \frac{2}{3}$

$$P[X \geq 1] = 1 - P[X < 1] = 1 - P[X = 0] = 1 - \left(\frac{1}{3}\right)^6 = 0.9986$$

**17. For a R.V X,  $M_x(t) = \frac{1}{81}(e^t + 2)^4$ . Find  $P(X \leq 2)$ .**

**Sol:** Given  $M_x(t) = \frac{1}{81}(e^t + 2)^4 = \left(\frac{e^t}{3} + \frac{2}{3}\right)^4$  ----- (1)

For Binomial Distribution,  $M_x(t) = (q + pe^t)^n$ . ----- (2)

Comparing (1)&(2),

$$\therefore n = 4, \quad q = \frac{2}{3}, \quad p = \frac{1}{3}.$$

$$\begin{aligned} P(X \leq 2) &= P(X = 0) + P(X = 1) + P(X = 2) = 4C_0 \left(\frac{1}{3}\right)^0 \left(\frac{2}{3}\right)^4 + 4C_1 \left(\frac{1}{3}\right)^1 \left(\frac{2}{3}\right)^3 + 4C_2 \left(\frac{1}{3}\right)^2 \left(\frac{2}{3}\right)^2 \\ &= \frac{1}{81}(16 + 32 + 24) = \frac{72}{81} = 0.8889. \end{aligned}$$

**18. If a R.V X takes the values -1,0,1 with equal probability find the M.G.F of X.**

**Sol:**  $P[X = -1] = 1/3$ ,  $P[X = 0] = 1/3$ ,  $P[X = 1] = 1/3$

$$M_x(t) = \sum_x e^{tx} P(X = x) = \frac{1}{3}e^{-t} + \frac{1}{3} + \frac{1}{3}e^t = \frac{1}{3}(1 + e^t + e^{-t}).$$

**19. A die is thrown 3 times. If getting a 6 is considered as success find the probability of atleast 2 success.**

**Sol:**  $p = \frac{1}{6}, q = \frac{5}{6}, n = 3$ .

$$P(\text{at least 2 success}) = P(X \geq 2) = P(X=2) + P(X=3)$$

$$= 3C_2 \left(\frac{1}{6}\right)^2 \frac{5}{6} + 3C_3 \left(\frac{1}{6}\right)^3 = \frac{2}{27}.$$

20. Find p for a Binomial variate X if n=6, and  $9P(X=4)=P(X=2)$ .

Sol:  $9P(X=4) = P(X=2) \Rightarrow 9\binom{6}{4}p^4q^2 = \binom{6}{2}p^2q^4$   
 $\Rightarrow 9p^2 = q^2 = (1-p)^2 \therefore 8p^2 + 2p - 1 = 0$   
 $\therefore p = \frac{1}{4} \left( \because p \neq -\frac{1}{2} \right)$

21. Comment on the following

“The mean of a BD is 3 and variance is 4”  
 For B.D, Variance < mean  
 $\therefore$  The given statement is wrong

22. Define poisson distribution

A discrete RV X is said to follow Poisson Distribution with parameter  $\lambda$  if its probability mass function is  $p(x) = \frac{e^{-\lambda} \lambda^x}{x!}$ ,  $x = 0, 1, 2, \dots, \infty$

23. If X is a Poisson variate such that  $P(X=2)=9P(X=4) + 90P(X=6)$ , find the variance

Ans :  $P[X=x] = \frac{e^{-\lambda} \lambda^x}{x!}$   
 Given  $P(X=2)=9P(X=4) + 90P(X=6)$   
 $\therefore \frac{e^{-\lambda} \lambda^2}{2!} = 9 \frac{e^{-\lambda} \lambda^4}{4!} + 90 \frac{e^{-\lambda} \lambda^6}{6!}$   
 $\Rightarrow \frac{1}{2} = \frac{9}{24} \lambda^2 + \frac{90}{720} \lambda^4 \Rightarrow \lambda^4 + 3\lambda^2 - 4 = 0$   
 $\Rightarrow (\lambda^2 + 4)(\lambda^2 - 1) = 0$   
 $\Rightarrow \lambda^2 = -4$  or  $\lambda^2 = 1$   
 hence  $\lambda = 1$  [ $\because \lambda^2 \neq -4$ ] Variance=1.

24. It is known that 5% of the books bound at a certain bindery have defective bindings. find the probability that 2 of 100 books bound by this bindery will have defective bindings.

Ans : Let X denote the number of defective bindings.

$p = \frac{5}{100}$   $n = 100$   $\therefore \lambda = np = 5$   
 $P[X=2] = \frac{e^{-\lambda} \lambda^2}{2!} = \frac{e^{-5}(25)}{2} = 0.084$

25. Find  $\lambda$ , if X follows Poisson Distribution such that  $P(X=2)=3P(X=3)$ .

Sol:  $P(X=2)=3P(X=3) \Rightarrow \frac{e^{-\lambda} \lambda^2}{2!} = \frac{3e^{-\lambda} \lambda^3}{3!} \Rightarrow \frac{1}{2} = \frac{3\lambda}{6} \Rightarrow \lambda = 1.$

26. If X is a Poisson variate such that  $P(X=1) = \frac{3}{10}$  and  $P(X=2) = \frac{1}{5}$ .

Find  $P(X=0)$  and  $P(X=3)$ .

Sol:  $P(X=1) = \frac{3}{10} \Rightarrow \frac{e^{-\lambda} \lambda}{1} = \frac{3}{10}$  .....(1)  
 $P(X=2) = \frac{1}{5} \Rightarrow \frac{e^{-\lambda} \lambda^2}{2} = \frac{1}{5}$  .....(2)

$$\frac{(2)}{(1)} \Rightarrow \frac{\lambda}{2} = \frac{10}{15} \Rightarrow \lambda = \frac{4}{3} \quad \therefore P(X=0) = \frac{e^{-\frac{4}{3}} \left(\frac{4}{3}\right)^0}{0!} = 0.2636$$

$$\therefore P(X=3) = \frac{e^{-\frac{4}{3}} \left(\frac{4}{3}\right)^3}{3!}$$

27. For a Poisson Variate  $X$ ,  $E(X^2) = 6$ . What is  $E(X)$ .

Sol:  $\lambda^2 + \lambda = 6 \Rightarrow \lambda^2 + \lambda - 6 = 0 \Rightarrow \lambda = 2, -3$ .

But  $\lambda > 0 \therefore \lambda = 2$  Hence  $E(X) = \lambda = 2$

28. A Certain Blood Group type can be find only in 0.05% of the people. If the population of a randomly selected group is 3000. What is the Probability that atleast a people in the group have this rare blood group.

Sol:  $p=0.05\% = 0.0005$   $n=3000$   $\therefore \lambda = np = 1.5$

$$P(X \geq 2) = 1 - P(X < 2) = 1 - P(X = 0) - P(X = 1)$$

$$= 1 - e^{-1.5} \left[ 1 + \frac{1.5}{1} \right] = 0.4422.$$

29. If  $X$  is a poisson variate with mean  $\lambda$  show that  $E[X^2] = \lambda E[X+1]$

$$E[X^2] = \lambda^2 + \lambda$$

$$E(X+1) = E[X] + 1 \quad \therefore E[X^2] = \lambda E[X+1]$$

30. Find the M.G.F of Poisson Distribution.

Ans :

$$M_X(t) = \sum_{x=0}^{\infty} e^{tx} \frac{\lambda^x e^{-\lambda}}{x!} = \sum_{x=0}^{\infty} \frac{(e^t \lambda)^x e^{-\lambda}}{x!} = e^{-\lambda} \sum_{x=0}^{\infty} \frac{(e^t \lambda)^x}{x!} = e^{-\lambda} e^{\lambda e^t} = e^{\lambda(e^t - 1)}$$

31. A discrete RV  $X$  has M.G.F  $M_X(t) = e^{2(e^t - 1)}$ . Find  $E(X)$ ,  $\text{var}(X)$  and  $P(X=0)$

Ans :  $M_X(t) = e^{2(e^t - 1)} \Rightarrow X$  follows Poisson Distribution  $\therefore \lambda = 2$

$$\text{Mean} = E(X) = \lambda = 2 \quad \text{Var}(X) = \lambda = 2$$

$$P[X=0] = \frac{e^{-\lambda} \lambda^0}{0!} = \frac{e^{-2} 2^0}{0!} = e^{-2}$$

32. If the probability that a target is destroyed on any one shot is 0.5, what is the probability that it would be destroyed on 6<sup>th</sup> attempt?

Ans : Given  $p = 0.5$   $q = 0.5$

By Geometric distribution

$$P[X=x] = q^x p, x = 0, 1, 2, \dots$$

since the target is destroyed on 6<sup>th</sup> attempt  $x = 5$

$$\therefore \text{Required probability} = q^x p = (0.5)^6 = 0.0157$$

33. Find the M.G.F of Geometric distribution

$$M_X(t) = E(e^{tx}) = \sum_{x=0}^{\infty} e^{tx} q^x p = p \sum_{x=0}^{\infty} (qe^t)^x$$

$$= p[1 - qe^t]^{-1} = \frac{p}{1 - qe^t}$$

34. Find the mean and variance of the distribution  $P[X=x]=2^{-x}$ ,  $x=1,2,3,\dots$

**Solution:**

$$P[X=x] = \frac{1}{2^x} = \left(\frac{1}{2}\right)^{x-1} \frac{1}{2}, x=1,2,3,\dots$$

$$\therefore p = \frac{1}{2} \text{ and } q = \frac{1}{2}$$

$$\text{Mean} = \frac{q}{p} = 1; \text{ Variance} = \frac{q}{p^2} = 2$$

35. Find the expected value and the variance of the number of times one must throw a die until the outcome 1 has occurred 4 times.

**Solution:**

X follows the negative binomial distribution with parameter  $r = 4$  and  $p=1/6$

$$E(X) = \text{mean} = r P = r q Q = r (1-p) (1/p) = 20. \quad (p=1/Q \text{ and } q=P/Q)$$

$$\text{Variance} = r p Q = r(1-p)/p^2 = 120.$$

36. If a boy is throwing stones at a target, what is the probability that his 10<sup>th</sup> throw is his 5<sup>th</sup> hit, if the probability of hitting the target at any trial is  $1/2$ ?

**Solution:**

Since 10<sup>th</sup> throw should result in the 5<sup>th</sup> successes, the first 9 throws ought to have resulted in 4 successes and 5 failures.

$$n = 10, r = 5, p = \frac{1}{2} = q$$

$$\therefore \text{Required probability} = P(X=5) = {}^{(5+5-1)}C_5 (1/2)^5 (1/2)^5 \\ = {}^9C_4 (1/2^{10}) = 0.123$$

37. Find the MGF of a uniform distribution in (a, b)?

**Ans :**

$$M_X(t) = \frac{1}{b-a} \int_a^b e^{tx} dx = \frac{e^{bt} - e^{at}}{(b-a)t}$$

38. Find the MGF of a RV X which is uniformly distributed over (-2, 3)

$$M_X(t) = \frac{1}{5} \int_{-2}^3 e^{tx} dx = \frac{e^{3t} - e^{-2t}}{5t} \text{ for } t \neq 0$$

39. The M.G.F of a R.V X is of the form  $M_X(t) = (0.4e^t + 0.6)^8$  what is the M.G.F of the R.V,  $Y = 3X + 2$

$$M_Y(t) = e^{2t} M_X(t) = e^{2t} ((0.4) e^{3t} + 0.6)^8$$

40. If X is uniformly distributed with mean 1 and variance  $\frac{4}{3}$  find  $P(X < 0)$

**Ans :** Let X follows uniform distribution in (a,b)

$$\text{mean} = \frac{b+a}{2} = 1 \text{ and Variance} = \frac{(b-a)^2}{12} = \frac{4}{3}$$

$$\therefore a+b = 2 \quad (b-a)^2 = 16 \Rightarrow b-a = \pm 4$$

Solving we get  $a=-1$   $b=3$

$$\therefore f(X) = \frac{1}{4}, -1 < x < 3$$

$$\therefore P[X < 0] = \int_{-1}^0 f(x) dx = \frac{1}{4}$$

**41. A RV X has a uniform distribution over (-4, 4) compute  $P(|X| > 2)$**

**Ans :**

$$f(x) = \begin{cases} \frac{1}{8}, & -4 < x < 4 \\ 0 & \text{other wise} \end{cases}$$

$$P(|X| > 2) = 1 - P(|X| \leq 2) = 1 - P(-2 < X < 2) = 1 - \int_{-2}^2 f(x) dx = 1 - \frac{4}{8} = \frac{1}{2}$$

**42. If X is Uniformly distributed in  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ . Find the p.d.f of  $Y = \tan X$ .**

$$\text{Sol: } f_X(x) = \frac{1}{\pi}; X = \tan^{-1} Y \Rightarrow \frac{dx}{dy} = \frac{1}{1+y^2}.$$

$$\therefore f_Y(y) = f_X(x) \left| \frac{dx}{dy} \right| \Rightarrow f_Y(y) = \frac{1}{\pi(1+y^2)}, -\infty < y < \infty$$

**43. If X is uniformly distributed in (-1,1). Find the p.d.f of  $y = \sin \frac{\pi x}{2}$ .**

**Sol:**

$$f_X(x) = \begin{cases} \frac{1}{2}, & -1 < x < 1 \\ 0, & \text{otherwise} \end{cases},$$

$$x = \frac{2 \sin^{-1} y}{\pi} \Rightarrow \frac{dx}{dy} = \frac{2}{\pi} \frac{1}{\sqrt{1-y^2}} \text{ for } -1 \leq y \leq 1$$

$$f_Y(y) = \frac{1}{2} \left[ \frac{2}{\pi} \frac{1}{\sqrt{1-y^2}} \right] \Rightarrow f_Y(y) = \frac{1}{\pi} \frac{1}{\sqrt{1-y^2}} \text{ for } -1 \leq y \leq 1$$

**44. The time (in hours) required to repair a machine is exponentially distributed with parameter  $\lambda = \frac{1}{2}$  what is the probability that a repair takes at least 10 hours given that its duration exceeds 9 hours?**

**Ans :**

Let X be the RV which represents the time to repair machine.

$$P[X \geq 10 / X \geq 9] = P[X \geq 1] \text{ (by memory less property)}$$

$$= \int_1^{\infty} \frac{1}{2} e^{-x/2} dx = 0.6065$$

**45. The time (in hours) required to repair a machine is exponentially distributed with parameter  $\lambda = \frac{1}{3}$  what is the probability that the repair time exceeds 3 hours?**

**Ans :** X – represents the time to repair the machine

$$\therefore f(x) = \frac{1}{3} e^{-x/3} > 0$$

$$P(X > 3) = \int_3^{\infty} \frac{1}{3} e^{-x/3} dx = e^{-1} = 0.3679$$

**46. Find the M.G.F of an exponential distribution with parameter  $\lambda$ .**

$$\text{Sol: } M_x(t) = \lambda \int_0^{\infty} e^{tx} e^{-\lambda x} dx = \lambda \int_0^{\infty} e^{-(\lambda-t)x} dx = \frac{\lambda}{\lambda-t}$$

**47. State the memory less property of the exponential distribution.**

**Soln:** If X is exponential distributed with parameter  $\lambda$  then

$$P(X > s + t / X > s) = P(X > t) \text{ for } s, t > 0$$

**48. If X has a exponential distribution with parameter  $\lambda$ , find the p.d.f of  $Y = \log X$ .**

$$\text{Sol: } Y = \log X \Rightarrow e^y = x \Rightarrow \frac{dx}{dy} = e^y$$

$$f_Y(y) = f_X(x) \left| \frac{dx}{dy} \right| \Rightarrow f_Y(y) = e^y \lambda e^{-\lambda e^y}$$

**49. If X has Exponential Distribution with parameter 1, find the p.d.f of  $Y = \sqrt{X}$ .**

$$\text{Sol: } Y = \sqrt{X} \Rightarrow X = Y^2 \quad f_X(x) = e^{-x}, x > 0.$$

$$f_Y(y) = f_X(x) \left| \frac{dx}{dy} \right| = 2ye^{-x} = 2ye^{-y^2}, y > 0.$$

**50. Write the M.G.F of Gamma distribution**

$$\begin{aligned} M_x(t) &= E(e^{tx}) = \int_0^{\infty} e^{tx} f(x) dx \\ &= \frac{\lambda^\gamma}{\Gamma \gamma} \int_0^{\infty} e^{-(\lambda-t)x} x^{\gamma-1} dx = \frac{\lambda^\gamma}{\Gamma \gamma} \frac{\Gamma \gamma}{(\lambda-t)^\gamma} \\ \therefore Mx(t) &= \left(1 - \frac{t}{\lambda}\right)^{-\gamma} \end{aligned}$$

**51. Define Normal distribution**

A normal distribution is a continuous distribution given by

$$y = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} \text{ where X is a continuous normal variate distributed with density}$$

$$\text{function } f(X) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{X-\mu}{\sigma}\right)^2} \text{ with mean } \mu \text{ and standard deviation } \sigma$$

**52. What are the properties of Normal distribution**

- (i) The normal curve is symmetrical when  $p = q$  or  $p \approx q$ .
- (ii) The normal curve is single peaked curve.

(iii) The normal curve is asymptotic to x-axis as y decreases rapidly when x increases numerically.

(iv) The mean, median and mode coincide and lower and upper quartile are equidistant from the median.

(v) The curve is completely specified by mean and standard deviation along with the value  $y_0$ .

**53. Write any four properties of normal distribution.**

- Sol:** (1) The curve is Bell shaped  
 (2) Mean, Median, Mode coincide  
 (3) All odd moments vanish  
 (4) x - axis is an asymptote of the normal curve

**54. If X is a Normal variate with mean 30 and SD 5. Find P [26 < X < 40].**

**Sol:**  $P[26 < X < 40] = P[-0.8 \leq Z \leq 2]$  where  $Z = \frac{X - 30}{5}$   $\left\{ \because Z = \frac{X - \mu}{\sigma} \right\}$   
 $= P[0 \leq Z \leq 0.8] + P[0 \leq Z \leq 2]$   
 $= 0.2881 + 0.4772$   
 $= 0.7653.$

**55. If X is normally distributed RV with mean 12 and SD 4. Find P [X ≤ 20].**

**Sol:**  $P[X \leq 20] = P[Z \leq 2]$  where  $Z = \frac{X - 12}{4}$   $\left\{ \because Z = \frac{X - \mu}{\sigma} \right\}$   
 $= P[-\infty \leq Z \leq 0] + P[0 \leq Z \leq 2]$   
 $= 0.5 + 0.4772$   
 $= 0.9772.$

**56. If X is a N(2,3), find  $P\left[Y \geq \frac{3}{2}\right]$  where  $Y+1=X$ .**

**Answer:**

$$P\left[Y \geq \frac{3}{2}\right] = P\left[X - 1 \geq \frac{3}{2}\right] = P[X \geq 2.5] = P[Z \geq 0.17] = 0.5 - P[0 \leq Z \leq 0.17]$$

$$= 0.5 - 0.0675 = 0.4325$$

**57.. If X is a RV with p.d.f  $f(x) = \frac{x}{12}$  in  $1 < x < 5$  and =0, otherwise. Find the p.d.f of  $Y=2X-3$ .**

**Sol:**  $Y=2X-3 \Rightarrow \frac{dx}{dy} = \frac{1}{2}$   
 $f_Y(y) = f_X(x) \left| \frac{dx}{dy} \right| = \frac{y+3}{4}, \text{ in } -1 < y < 7.$

**58.. If X is a Normal R.V with mean zero and variance  $\sigma^2$  Find the p.d.f of  $Y = e^X$ .**

**Sol:**  $Y = e^X \Rightarrow \log Y = X \Rightarrow \frac{dx}{dy} = \frac{1}{y}$   
 $f_Y(y) = f_X(x) \left| \frac{dx}{dy} \right| = \frac{1}{y} f_X(\log y)$   
 $= \frac{1}{\sigma y \sqrt{2\pi}} \exp\left(-(\log y - \mu^2) / 2\sigma^2\right)$

59. If X has the p.d.f  $f(x) = \begin{cases} x, 0 < x < 1 \\ 0, \text{ otherwise} \end{cases}$  find the p.d.f of  $Y = 8X^3$ .

Sol:  $Y = 8X^3 \Rightarrow X = \frac{1}{2}Y^{\frac{1}{3}} \Rightarrow \frac{dx}{dy} = \frac{1}{6}y^{-\frac{2}{3}}$

$$f_Y(y) = f_X(x) \left| \frac{dx}{dy} \right| = (x) \left( \frac{1}{6}Y^{-\frac{2}{3}} \right) = \frac{1}{12}Y^{-\frac{1}{3}}, Y > 0$$

60. The p.d.f of a R.V X is  $f(x) = 2x, 0 < x < 1$ . Find the p.d.f of  $Y = 3X + 1$ .

Sol:  $Y = 3X + 1 \Rightarrow X = \frac{Y-1}{3}$

$$f_Y(y) = f_X(x) \left| \frac{dx}{dy} \right| = 2x \frac{1}{3} = 2 \left( \frac{y-1}{3} \right) \left( \frac{1}{3} \right) = \frac{2(y-1)}{9}, 1 < y < 4.$$

### Moment generating functions

#### 1. Define $n^{th}$ Moments about Origin

The  $n^{th}$  moment about origin of a RV X is defined as the expected value of the  $n^{th}$  power of X.

For discrete RV X, the  $n^{th}$  moment is defined as  $E(X^n) = \sum_i x_i^n p_i = \mu_n', n \geq 1$

For continuous RV X, the  $n^{th}$  moment is defined as  $E(X^n) = \int_{-\infty}^{\infty} x^n f(x) dx = \mu_n', n \geq 1$

#### 2. Define $n^{th}$ Moments about Mean

The  $n^{th}$  central moment of a discrete RV X is its moment about its mean  $\bar{X}$  and is defined as

$$E(X - \bar{X})^n = \sum_i (x_i - \bar{X})^n p_i = \mu_n, n \geq 1$$

The  $n^{th}$  central moment of a continuous RV X is defined as

$$E(X - \bar{X})^n = \int_{-\infty}^{\infty} (x - \bar{X})^n f(x) dx = \mu_n, n \geq 1$$

#### 3. Define Variance

The second moment about the mean is called variance and is represented as  $\sigma_x^2$

$$\sigma_x^2 = E[X^2] - [E(X)]^2 = \mu_2' - (\mu_1')^2$$

The positive square root  $\sigma_x$  of the variance is called the standard deviation.

#### 4. Define Moment Generating Functions (M.G.F)

Moment generating function of a RV X about the origin is defined as

$$M_X(t) = E(e^{tx}) = \begin{cases} \sum_x e^{tx} P(x), \text{ if } X \text{ is discrete.} \\ \int_{-\infty}^{\infty} e^{tx} f(x) dx, \text{ if } X \text{ is continuous.} \end{cases}$$

Moment generating function of a RV X about the mean is defined as

$$M_{X-\mu}(t) = E(e^{t(x-\mu)})$$

## 5. Properties of MGF

1.  $M_{X-a}(t) = e^{-at} M_X(t)$

Proof:

$$M_{X-a}(t) = E(e^{t(x-a)}) = E(e^{tx} \cdot e^{-at}) = E(e^{tx}) e^{-at} = e^{-at} M_X(t)$$

2. If X and Y are two independent RVs, then  $M_{X+Y}(t) = M_X(t) \cdot M_Y(t)$

Proof:

$$M_{X+Y}(t) = E(e^{t(X+Y)}) = E(e^{tX+tY}) = E(e^{tX} \cdot e^{tY}) = E(e^{tX}) \cdot E(e^{tY}) = M_X(t) \cdot M_Y(t)$$

3. If  $M_X(t) = E(e^{tx})$  then  $M_{cX}(t) = M_X(ct)$

Proof:

$$M_{cX}(t) = E(e^{tcX}) = E(e^{(ct)X}) = M_X(ct)$$

4. If  $Y=aX+b$  then  $M_Y(t) = e^{bt} M_X(at)$  where  $M_X(t)$  = MGF of X.

5. If  $M_{X_1}(t) = M_{X_2}(t)$  for all t, then  $F_{X_1}(x) = F_{X_2}(x)$  for all x.

## UNIT-I RANDOM VARIABLE

1. If the RV X takes the values 1, 2, 3 and 4 such that  $2P(X=1)=3P(X=2)=P(X=3)=5P(X=4)$ , find the probability distribution and cumulative distribution function of X.

2. A RV X has the following probability distribution.

X:	-2	-1	0	1	2	3
P(x):	0.1	K	0.2	2K	0.3	3K

Find (1) K, (2)  $P(X < 2)$ ,  $P(-2 < X < 2)$ , (3) CDF of X, (4) Mean of X.

3. If X is RV with probability distribution

X:	1	2	3
P(X):	1/6	1/3	1/2

Find its mean and variance and  $E(4X^3 + 3X + 11)$ .

4. A RV X has the following probability distribution.

X:	0	1	2	3	4	5	6	7
P(x):	0	K	2K	2K	3K	K <sup>2</sup>	2K <sup>2</sup>	7K <sup>2</sup> +K

Find (1) K, (2)  $P(X < 2)$ ,  $P(1.5 < X < 4.5/X > 2)$ , (3) The smallest value of  $\lambda$  for which  $P(X \leq \lambda) > 1/2$ .

5. A RV X has the following probability distribution.

X:	0	1	2	3	4
P(x):	K	3K	5K	7K	9K

Find (1) K, (2)  $P(X < 3)$  and  $P(0 < X < 4)$ , (3) Find the distribution function of X.

6. If the density function of a continuous RV X is given by  $f(x) = \begin{cases} ax, & 0 \leq x \leq 1 \\ a, & 1 \leq x \leq 2 \\ 3a - ax, & 2 \leq x \leq 3 \\ 0, & \text{Otherwise} \end{cases}$

Find i) a ii) CDF of X.

7. A continuous RV X that can assume any value between  $x=2$  and  $x=5$  has a density function given by  $f(x) = k(1+x)$ . Find  $P(X < 4)$ .

8. If the density function of a continuous RV X is given by  $f(x) = kx^2 e^{-x}$ ,  $x > 0$ . Find k, mean and variance.

9. If the cdf of a continuous RV X is given by  $F(x) = \begin{cases} 0, & x < 0 \\ x^2, & 0 \leq x < \frac{1}{2} \\ 1 - \frac{3}{25}(3-x^2), & \frac{1}{2} \leq x < 3 \\ 1, & x \geq 3 \end{cases}$

Find the pdf of X and evaluate  $P(|X| \leq 1)$  and  $P(\frac{1}{3} \leq X < 4)$ .

10. A continuous RV X has the pdf  $f(x) = Kx^2 e^{-x}$ ,  $x \geq 0$ . Find the  $r^{\text{th}}$  moment about

origin. Hence find mean and variance of X.

11. Find the mean, variance and moment generating function of a binomial distribution.
12. 6 dice are thrown 729 times. How many times do you expect at least three dice to show 5 or 6?
13. It is known that the probability of an item produced by a certain machine will be defective is 0.05. If the produced items are sent to the market in packets of 20, find the no. of packets containing at least, exactly and at most 2 defective items in a consignment of 1000 packets using (i) Binomial distribution
14. Find mean, variance and MGF of Geometric distribution.
15. The pdf of the length of the time that a person speaks over phone is

$$f(x) = \begin{cases} Be^{-\frac{x}{6}}, & x > 0 \\ 0, & \text{otherwise} \end{cases}$$

what is the probability that the person will talk for (i) more than 8 minutes (ii) less than 4 minutes (iii) between 4 and 8 minutes.

16. State and prove the memory less property of the exponential distribution.
17. If the service life, in hours, of a semiconductor is a RV having a Weibull distribution with the parameters  $\alpha = 0.025$  and  $\beta = 0.5$ ,
  1. How long can such a semiconductor be expected to last?
  2. What is the probability that such a semiconductor will still be in operating condition after 4000 hours?

# Unit II Two Dimensional Random Variables

## 1. Define Two-dimensional Random variables.

Let  $S$  be the sample space associated with a random experiment  $E$ . Let  $X=X(S)$  and  $Y=Y(S)$  be two functions each assigning a real number to each  $s \in S$ . Then  $(X,Y)$  is called a two dimensional random variable.

## 2. The following table gives the joint probability distribution of $X$ and $Y$ . Find the marginal density functions of $X$ and $Y$ .

Y / X	1	2	3
1	0.1	0.1	0.2
2	0.2	0.3	0.1

**Answer:**

The marginal density of  $X$

$$P(X = x_i) = p_{i*} = \sum_j p_{ij}$$

X	1	2	3
P(X)	0.3	0.4	0.3

The marginal density of  $Y$

$$P(Y = y_j) = p_{*j} = \sum_i p_{ij}$$

Y	1	2
P(Y)	0.4	0.6

## 3. If $f(x,y) = kxye^{-(x^2+y^2)}$ , $x \geq 0, y \geq 0$ is the joint pdf, find $k$ .

**Answer:**

$$\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x,y) dy dx = 1 \Rightarrow \int_0^{\infty} \int_0^{\infty} kxye^{-(x^2+y^2)} dy dx = 1$$

$$k \int_0^{\infty} xe^{-x^2} dx \int_0^{\infty} ye^{-y^2} dy = 1 \Rightarrow \frac{k}{4} = 1$$

$$\therefore k = 4$$

## 4. Let the joint pdf of $X$ and $Y$ is given by $f(x,y) = \begin{cases} cx(1-x), & 0 \leq x \leq y \leq 1 \\ 0, & \text{otherwise} \end{cases}$

**Find the value of  $C$ .**

**Answer:**

$$\int_0^1 \int_0^y Cx(1-x) dx dy = 1 \Rightarrow \frac{C}{6} \int_0^1 (3y^2 - 2y^3) dy = 1 \Rightarrow \frac{C}{6} \left[ 1 - \frac{1}{2} \right] = 1$$

## 5. The joint p.m.f of $(X,Y)$ is given by $P(x,y) = k(2x+3y)$ , $x = 0,1,2; y = 1,2,3$ . Find the marginal probability distribution of $X$ .

**Answer:**

X \ Y	1	2	3
0	3k	6k	9k
1	5k	8k	11k
2	7k	10k	13k

$$\sum_y \sum_x P(x,y) = 1 \Rightarrow 72k = 1 \therefore k = \frac{1}{72}$$

Marginal distribution of  $X$ :

X	0	1	2
P(X)	18/72	24/72	30/72

6. If X and Y are independent RVs with variances 8 and 5. find the variance of 3X+4Y.

Answer:

Given  $\text{Var}(X)=8$  and  $\text{Var}(Y)=5$

To find:  $\text{var}(3X-4Y)$

We know that  $\text{Var}(aX - bY) = a^2\text{Var}(X) + b^2\text{Var}(Y)$

$$\text{var}(3X - 4Y) = 3^2\text{Var}(X) + 4^2\text{Var}(Y) = (9)(8) + (16)(5) = 152$$

7. Find the value of k if  $f(x, y) = k(1-x)(1-y)$  for  $0 < x, y < 1$  is to be joint density function.

Answer:

We know that  $\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) dy dx = 1$

$$\int_0^1 \int_0^1 k(1-x)(1-y) dx dy = 1 \Rightarrow k \left[ \int_0^1 (1-x) dx \right] \left[ \int_0^1 (1-y) dy \right] = 1$$

$$k \left[ x - \frac{x^2}{2} \right]_0^1 \left[ y - \frac{y^2}{2} \right]_0^1 = 1 \Rightarrow \frac{k}{4} = 1 \quad \therefore k = 4$$

8. If X and Y are random variables having the joint p.d.f

$$f(x, y) = \frac{1}{8}(6-x-y), \quad 0 < x < 2, \quad 2 < y < 4, \quad \text{find } P(X < 1, Y < 3)$$

Answer:

$$P(X < 1, Y < 3) = \frac{1}{8} \int_0^1 \int_2^3 (6-x-y) dy dx = \frac{1}{8} \int_0^1 \left( \frac{7}{2} - x \right) dx = \frac{3}{8}$$

9. The joint p.d.f of (X,Y) is given by  $f(x, y) = \frac{1}{4}(1+xy), |x| < 1, |y| < 1$  and  $= 0$ , otherwise.

Show that X and Y are not independent.

Answer:

Marginal p.d.f of X :

$$f(x) = \int_{-\infty}^{\infty} f(x, y) dy = \int_{-1}^1 \frac{1}{4}(1+xy) dy = \frac{1}{2}, \quad -1 < x < 1$$

$$f(x) = \begin{cases} \frac{1}{2}, & -1 < x < 1 \\ 0, & \text{otherwise} \end{cases}$$

Marginal p.d.f of Y :

$$f(y) = \int_{-\infty}^{\infty} f(x, y) dx = \int_{-1}^1 \frac{1}{4}(1+xy) dx = \frac{1}{2}, \quad -1 < y < 1$$

$$f(y) = \begin{cases} \frac{1}{2}, & -1 < y < 1 \\ 0, & \text{otherwise} \end{cases}$$

Since  $f(x)f(y) \neq f(x, y)$ , X and Y are not independent.

10. The conditional p.d.f of X and Y=y is given by  $f\left(\frac{x}{y}\right) = \frac{x+y}{1+y} e^{-x}, 0 < x < \infty, 0 < y < \infty$ ,

find  $P[X < 1 / Y = 2]$ .

Answer:

$$\text{When } y=2, f(x/y=2) = \frac{x+2}{3} e^{-x}$$

$$\therefore P[X < 1 / Y = 2] = \int_0^1 \frac{x+2}{3} e^{-x} dx = \frac{1}{3} \int_0^1 x e^{-x} dx + \frac{2}{3} \int_0^1 e^{-x} dx = 1 - \frac{4}{3} e^{-1}$$

11. The joint p.d.f of two random variables X and Y is given by

$$f(x, y) = \frac{1}{8}x(x-y), 0 < x < 2, -x < y < x \text{ and } = 0, \text{ otherwise.}$$

Find  $f(y/x)$

Answer:

$$f(x) = \int_{-\infty}^{\infty} f(x, y) dy = \int_{-x}^x \frac{1}{8}x(x-y) dy = \frac{x^3}{4}, \quad 0 < x < 2$$

$$f(y/x) = \frac{f(x, y)}{f(x)} = \frac{x-y}{2x^2}, -x < y < x$$

12. If the joint pdf of (X,Y) is  $f(x, y) = \frac{1}{4}, 0 \leq x, y < 2$ , find  $P[X+Y \leq 1]$

Answer:

$$P[X+Y \leq 1] = \int_0^1 \int_0^{1-y} \frac{1}{4} dx dy = \frac{1}{4} \int_0^1 (1-y) dy = \frac{1}{8}.$$

13. If the joint pdf of (X,Y) is  $f(x, y) = 6e^{-2x-3y}, x \geq 0, y \geq 0$ , find the conditional density of Y given X.

Answer:

$$\text{Given } f(x, y) = 6e^{-2x-3y}, x \geq 0, y \geq 0,$$

The Marginal p.d.f of X:

$$f(x) = \int_0^{\infty} 6e^{-2x-3y} dy = 2e^{-2x}, x \geq 0$$

Conditional density of Y given X:

$$f(y/x) = \frac{f(x, y)}{f(x)} = \frac{6e^{-2x-3y}}{2e^{-2x}} = 3e^{-3y}, y \geq 0.$$

14. Find the probability distribution of (X+Y) given the bivariate distribution of (X,Y).

X \ Y	1	2
1	0.1	0.2
2	0.3	0.4

Answer:

X+Y	P(X+Y)
2	P(2)=P(X=1, Y=1)=0.1
3	P(3)=P(X=1, Y=2)+P(X=2, Y=1)=0.2+0.3=0.5
4	P(4)=P(X=2, Y=2)=0.4

X+Y	2	3	4
Probability	0.1	0.5	0.4

15. The joint p.d.f of (X,Y) is given by  $f(x, y) = 6e^{-(x+y)}, 0 \leq x, y \leq \infty$ . Are X and Y independent?

Answer:

Marginal density of X:

$$f(x) = \int_{-\infty}^{\infty} f(x, y) dy = \int_0^{\infty} 6e^{-(x+y)} dy = e^{-x}, 0 \leq x$$

Marginal density of Y;

$$f(y) = \int_{-\infty}^{\infty} f(x, y) dx = \int_0^{\infty} 6e^{-(x+y)} dx = e^{-y}, y \leq \infty$$

$$\Rightarrow f(x)f(y) = f(x, y)$$

\(\therefore\) X and Y are independent.

16. The joint p.d.f of a bivariate R.V (X,Y) is given by

$$f(x, y) = \begin{cases} 4xy, & 0 < x < 1, y < 1 \\ 0, & \text{otherwise} \end{cases} \quad \text{.Find } p(X+Y < 1)$$

**Answer:**

$$\begin{aligned} P[X + Y < 1] &= \int_0^1 \int_0^{1-y} 4xy \, dx \, dy = 2 \int_0^1 y(1-y)^2 \, dy \\ &= 2 \left[ \frac{y^2}{2} - \frac{2y^3}{3} + \frac{y^4}{4} \right]_0^1 \\ &= 2 \left[ \frac{1}{2} - \frac{2}{3} + \frac{1}{4} \right] = \frac{1}{6} \end{aligned}$$

### 17. Define Co – Variance:

If X and Y are two r.v.s then co – variance between them is defined as

$$\text{Cov}(X, Y) = E\{X - E(X)\} \{Y - E(Y)\}$$

$$\text{(ie) Cov}(X, Y) = E(XY) - E(X)E(Y)$$

### 18. State the properties of Co – variance;

1. If X and Y are two independent variables, then  $\text{Cov}(X, Y) = 0$ . But the Converse need not be true

2.  $\text{Cov}(aX, bY) = ab \text{Cov}(X, Y)$

3.  $\text{Cov}(X + a, Y + b) = \text{Cov}(X, Y)$

4.  $\text{Cov}\left(\frac{X - \bar{X}}{\sigma_X}, \frac{Y - \bar{Y}}{\sigma_Y}\right) = \frac{1}{\sigma_X \sigma_Y} \text{Cov}(X, Y)$

5.  $\text{Cov}(aX + b, cY + d) = ac \text{Cov}(X, Y)$

6.  $\text{Cov}(X + Y, Z) = \text{Cov}(X, Z) + \text{Cov}(Y, Z)$

7.  $\text{Cov}(aX + bY, cX + dY) = ac\sigma_X^2 + bd\sigma_Y^2 + (ad + bc)\text{Cov}(X, Y)$

where  $\sigma_X^2 = \text{Cov}(X, X) = \text{var}(X)$  and  $\sigma_Y^2 = \text{Cov}(Y, Y) = \text{var}(Y)$

### 19. Show that $\text{Cov}(aX + b, cY + d) = ac \text{Cov}(X, Y)$

**Answer:**

Take  $U = aX + b$  and  $V = cY + d$

Then  $E(U) = aE(X) + b$  and  $E(V) = cE(Y) + d$

$U - E(U) = a[X - E(X)]$  and  $V - E(V) = c[Y - E(Y)]$

$$\begin{aligned} \text{Cov}(aX + b, cY + d) &= \text{Cov}(U, V) = E[\{U - E(U)\} \{V - E(V)\}] = E[a\{X - E(X)\} c\{Y - E(Y)\}] \\ &= ac E[\{X - E(X)\} \{Y - E(Y)\}] = ac \text{Cov}(X, Y) \end{aligned}$$

### 20. If X & Y are independent R.V's, what are the values of $\text{Var}(X_1 + X_2)$ and $\text{Var}(X_1 - X_2)$

**Answer:**

$\text{Var}(X_1 \pm X_2) = \text{Var}(X_1) + \text{Var}(X_2)$  (Since X and Y are independent RV then

$\text{Var}(aX \pm bX) = a^2 \text{Var}(X) + b^2 \text{Var}(X)$ )

### 21. If $Y_1$ & $Y_2$ are independent R.V's, then covariance $(Y_1, Y_2) = 0$ . Is the converse of the above statement true? Justify your answer.

**Answer:**

The converse is not true. Consider

$X \sim N(0, 1)$  and  $Y = X^2$  since  $X \sim N(0, 1)$ ,

$E(X) = 0$ ;  $E(X^3) = E(XY) = 0$  since all odd moments vanish.

$\therefore \text{cov}(XY) = E(XY) - E(X)E(Y) = E(X^3) - E(X)E(Y) = 0$

$\therefore \text{cov}(XY) = 0$  but X & Y are independent

### 22. Show that $\text{cov}^2(X, Y) \leq \text{var}(X) \text{var}(Y)$

**Answer:**

$$\text{cov}(X, Y) = E(XY) - E(X)E(Y)$$

We know that  $[E(XY)]^2 \leq E(X^2)E(Y^2)$

$$\begin{aligned}\text{cov}^2(X, Y) &= [E(XY)]^2 + [E(X)]^2[E(Y)]^2 - 2E(XY)E(X)E(Y) \\ &\leq E(X)^2 E(Y)^2 + [E(X)]^2[E(Y)]^2 - 2E(XY)E(X)E(Y) \\ &\leq E(X)^2 E(Y)^2 + [E(X)]^2[E(Y)]^2 - E(X^2)E(Y)^2 - E(Y^2)E(X)^2 \\ &= \left\{E(X^2) - [E(X)]^2\right\} \left\{E(Y^2) - [E(Y)]^2\right\} \leq \text{var}(X) \text{var}(Y)\end{aligned}$$

**23. If X and Y are independent random variable find covariance between X+Y and X-Y.**

**Answer:**

$$\begin{aligned}\text{cov}[X + Y, X - Y] &= E[(X + Y)(X - Y)] - [E(X + Y)E(X - Y)] \\ &= E[X^2] - E[Y^2] - [E(X)]^2 + [E(Y)]^2 \\ &= \text{var}(X) - \text{var}(Y)\end{aligned}$$

**24. X and Y are independent random variables with variances 2 and 3. Find the variance 3X+4Y.**

**Answer:**

$$\text{Given } \text{var}(X) = 2, \text{var}(Y) = 3$$

We know that  $\text{var}(aX+Y) = a^2\text{var}(X) + \text{var}(Y)$

And  $\text{var}(aX+bY) = a^2\text{var}(X) + b^2\text{var}(Y)$

$$\text{var}(3X+4Y) = 3^2\text{var}(X) + 4^2\text{var}(Y) = 9(2) + 16(3) = 66$$

**25. Define correlation**

The correlation between two RVs X and Y is defined as

$$E[XY] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xyf(xy) dx dy$$

**26. Define uncorrelated**

Two RVs are uncorrelated with each other, if the correlation between X and Y is equal to the product of their means. i.e.,  $E[XY] = E[X].E[Y]$

**27. If the joint pdf of (X,Y) is given by  $f(x, y) = e^{-(x+y)}$ ,  $x \geq 0, y \geq 0$ . find E(XY).**

**Answer:**

$$E(XY) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xyf(x, y) dx dy = \int_0^{\infty} \int_0^{\infty} xye^{-(x+y)} dx dy = \int_0^{\infty} xe^{-x} dx \int_0^{\infty} ye^{-y} dy = 1$$

**28. A R.V X is uniformly distributed over(-1,1) and  $Y=X^2$ . Check if X and Y are correlated?**

**Answer:**

Given X is uniformly distributed in (-1,1), pdf of X is  $f(x) = \frac{1}{b-a} = \frac{1}{2}$ ,  $-1 \leq x \leq 1$

$$E(X) = \frac{1}{2} \int_{-1}^1 x dx = 0 \text{ and } E(XY) = E(X^3) = 0$$

$$\therefore \text{cov}(X, Y) = E(XY) - E(X)E(Y) = 0 \Rightarrow r(X, Y) = 0$$

Hence X and Y are uncorrelated.

**29. X and Y are discrete random variables. If  $\text{var}(X) = \text{var}(Y) = \sigma^2$ ,**

$$\text{cov}(X, Y) = \frac{\sigma^2}{2}, \text{ find } \text{var}(2X - 3Y)$$

**Answer:**

$$\begin{aligned}\text{var}(2X - 3Y) &= 4 \text{var}(X) + 9 \text{var}(Y) - 12 \text{cov}(X, Y) \\ &= 13\sigma^2 - 12 \frac{\sigma^2}{2} = 7\sigma^2\end{aligned}$$

**30. If  $\text{var}(X) = \text{var}(Y) = \sigma^2$ ,  $\text{cov}(X, Y) = \frac{\sigma^2}{2}$ , find the correlation between  $2X + 3$  and  $2Y - 3$**

**Answer:**

$$r(aX + b, cY + d) = \frac{ac}{|ac|} r(X, Y) \text{ where } a \neq 0, c \neq 0$$

$$\therefore r(2X + 3, 2Y - 3) = \frac{4}{|4|} r(X, Y) = r(X, Y) = \frac{\text{cov}(X, Y)}{\sigma_X \sigma_Y} = \frac{\sigma^2 / 2}{\sigma \cdot \sigma} = \frac{1}{2}$$

**31. Two independent random variables X and Y have 36 and 16. Find the correlation co-efficient between X+Y and X-Y**

**Answer:**

$$\therefore r(X + Y, X - Y) = \frac{\sigma_X^2 - \sigma_Y^2}{\sigma_X^2 + \sigma_Y^2} = \frac{36 - 16}{36 + 16} = \frac{20}{52} = \frac{4}{13}$$

**32. If the lines of regression of Y on X and X on Y are respectively  $a_1X + b_1Y + c_1 = 0$  and  $a_2X + b_2Y + c_2 = 0$ , prove that  $a_1b_2 \leq a_2b_1$ .**

**Answer:**

$$b_{yx} = -\frac{a_1}{b_1} \quad \text{and} \quad b_{xy} = -\frac{b_2}{a_2}$$

$$\text{Since } r^2 = b_{yx} b_{xy} \leq 1 \Rightarrow \frac{a_1}{b_1} \cdot \frac{b_2}{a_2} \leq 1$$

$$\therefore a_1 b_2 \leq a_2 b_1$$

**33. State the equations of the two regression lines. what is the angle between them?**

**Answer:**

Regression lines:

$$y - \bar{y} = r \frac{\sigma_y}{\sigma_x} (x - \bar{x}) \quad \text{and} \quad x - \bar{x} = r \frac{\sigma_x}{\sigma_y} (y - \bar{y})$$

$$\text{Angle } \theta = \tan^{-1} \left[ \frac{1 - r^2}{r} \left( \frac{\sigma_x \sigma_y}{\sigma_x^2 + \sigma_y^2} \right) \right]$$

**34. The regression lines between two random variables X and Y is given by  $3X + Y = 10$  and  $3X + 4Y = 12$ . Find the correlation between X and Y.**

**Answer:**

$$3X + 4Y = 12 \quad \Rightarrow b_{yx} = -\frac{3}{4}$$

$$3X + Y = 10 \quad \Rightarrow b_{xy} = -\frac{1}{3}$$

$$r^2 = \left(-\frac{3}{4}\right) \left(-\frac{1}{3}\right) = \frac{1}{4} \quad \Rightarrow r = -\frac{1}{2}$$

**35. Distinguish between correlation and regression.**

**Answer:**

By correlation we mean the casual relationship between two or more variables.

By regression we mean the average relationship between two or more variables.

### 36. State the Central Limit Theorem.

**Answer:**

If  $x_1, x_2, \dots, x_n$  are  $n$  independent identically distributed RVs with mean  $\mu$  and S.D  $\sigma$  and if  $\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$ , then the variate  $z = \frac{\bar{x} - \mu}{\sigma / \sqrt{n}}$  has a distribution that approaches the standard normal distribution as  $n \rightarrow \infty$  provided the m.g.f of  $x_i$  exist.

### 37. The lifetime of a certain kind of electric bulb may be considered as a RV with mean 1200 hours and S.D 250 hours. Find the probability that the average life time of exceeds 1250 hours using central limit theorem.

**Solution:**

Let  $X$  denote the life time of the 60 bulbs.

Then  $\mu = E(X) = 1200$  hrs. and  $\text{Var}(X) = (\text{S.D})^2 = \sigma^2 = (250)^2$  hrs.

Let  $\bar{X}$  denote the average life time of 60 bulbs.

By Central Limit Theorem,  $\bar{X}$  follows  $N\left(\mu, \frac{\sigma^2}{n}\right)$ .

Let  $Z = \frac{\bar{X} - \mu}{\sigma / \sqrt{n}}$  be the standard normal variable

$$\begin{aligned} P[\bar{X} > 1250] &= P[Z > 1.55] \\ &= 0.5 - P[0 < Z < 1.55] \\ &= 0.5 - 0.4394 = 0.0606 \end{aligned}$$

### 38. Joint probability distribution of (X, Y)

Let  $(X, Y)$  be a two dimensional discrete random variable. Let  $P(X=x_i, Y=y_j) = p_{ij}$ .  $p_{ij}$  is called the probability function of  $(X, Y)$  or joint probability distribution. If the following conditions are satisfied

1.  $p_{ij} \geq 0$  for all  $i$  and  $j$

$$2. \sum_j \sum_i p_{ij} = 1$$

The set of triples  $(x_i, y_j, p_{ij})$   $i=1, 2, 3, \dots$  and  $j=1, 2, 3, \dots$  is called the Joint probability distribution of  $(X, Y)$

### 39. Joint probability density function

If  $(X, Y)$  is a two-dimensional continuous RV such that

$$P\left\{x - \frac{dx}{2} \leq X \leq x + \frac{dx}{2} \text{ and } y - \frac{dy}{2} \leq Y \leq y + \frac{dy}{2}\right\} = f(x, y) dx dy$$

Then  $f(x, y)$  is called the joint pdf of  $(X, Y)$  provided the following conditions satisfied.

1.  $f(x, y) \geq 0$  for all  $(x, y) \in (-\infty, \infty)$

$$2. \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) dx dy = 1 \text{ and } f(x, y) \geq 0 \text{ for all } (x, y) \in (-\infty, \infty)$$

### 40. Joint cumulative distribution function (joint cdf)

If  $(X, Y)$  is a two dimensional RV then  $F(x, y) = P(X \leq x, Y \leq y)$  is called joint cdf of  $(X, Y)$

In the discrete case,

$$F(x, y) = \sum_{y_j \leq y} \sum_{x_i \leq x} p_{ij}$$

In the continuous case,

$$F(x, y) = P(-\infty < X \leq x, -\infty < Y \leq y) = \int_{-\infty}^y \int_{-\infty}^x f(x, y) dx dy$$

### 41. Marginal probability distribution (Discrete case)

Let  $(X, Y)$  be a two dimensional discrete RV and  $p_{ij} = P(X=x_i, Y=y_j)$  then  

$$P(X = x_i) = p_{i*} = \sum_j p_{ij}$$

is called the Marginal probability function.

The collection of pairs  $\{x_i, p_{i*}\}$  is called the Marginal probability distribution of X.

If  $P(Y = y_j) = p_{*j} = \sum_i p_{ij}$  then the collection of pairs  $\{x_i, p_{*j}\}$  is called the Marginal probability distribution of Y.

#### 42. Marginal density function (Continuous case)

Let  $f(x, y)$  be the joint pdf of a continuous two dimensional RV  $(X, Y)$ . The marginal density function of X is defined by 
$$f(x) = \int_{-\infty}^{\infty} f(x, y) dy$$

The marginal density function of Y is defined by 
$$f(y) = \int_{-\infty}^{\infty} f(x, y) dx$$

#### 43. Conditional probability function

If  $p_{ij} = P(X=x_i, Y=y_j)$  is the Joint probability function of a two dimensional discrete RV  $(X, Y)$  then the conditional probability function X given  $Y=y_j$  is defined by

$$P\left[X = x_i / Y = y_j\right] = \frac{P[X = x_i \cap Y = y_j]}{P[Y = y_j]}$$

The conditional probability function Y given  $X=x_i$  is defined by

$$P\left[Y = y_j / X = x_i\right] = \frac{P[X = x_i \cap Y = y_j]}{P[X = x_i]}$$

#### 44. Conditional density function

Let  $f(x, y)$  be the joint pdf of a continuous two dimensional RV  $(X, Y)$ . Then the Conditional density function of X given  $Y=y$  is defined by 
$$f(X/Y) = \frac{f_{XY}(x, y)}{f_Y(y)}$$
, where  $f(y)$  = marginal p.d.f of Y.

The Conditional density function of Y given  $X=x$  is defined by 
$$f(Y/X) = \frac{f_{XY}(x, y)}{f_X(x)}$$
,

where  $f(x)$  = marginal p.d.f of X.

#### 45. Define statistical properties

Two jointly distributed RVs X and Y are statistical independent of each other if and only if the joint probability density function equals the product of the two marginal probability density function

$$\text{i.e., } f(x, y) = f(x) \cdot f(y)$$

#### 46. The joint p.d.f of $(X, Y)$ is given by $f(x, y) = e^{-(x+y)}$ $0 \leq x, y \leq \infty$ . Are X and Y are independent?

Answer:

Marginal densities:

$$f(x) = \int_0^{\infty} e^{-(x+y)} dy = e^{-x} \quad \text{and} \quad f(y) = \int_0^{\infty} e^{-(x+y)} dx = e^{-y}$$

X and Y are independent since  $f(x, y) = f(x) \cdot f(y)$

#### 47. Define Co – Variance :

If X and Y are two r.v.s then co – variance between them is defined as

$$\text{Cov}(X, Y) = E\{X - E(X)\} \{Y - E(Y)\}$$

$$\text{(ie) Cov}(X, Y) = E(XY) - E(X)E(Y)$$

**48. State the properties of Co – variance;**

1. If X and Y are two independent variables, then  $\text{Cov}(X, Y) = 0$ . But the

Converse need not be true

2.  $\text{Cov}(aX, bY) = ab \text{Cov}(X, Y)$

3.  $\text{Cov}(X + a, Y + b) = \text{Cov}(X, Y)$

4. 
$$\text{Cov}\left(\frac{X - \bar{X}}{\sigma_X}, \frac{Y - \bar{Y}}{\sigma_Y}\right) = \frac{1}{\sigma_X \sigma_Y} \text{Cov}(X, Y)$$

5.  $\text{Cov}(aX + b, cY + d) = ac \text{Cov}(X, Y)$

6.  $\text{Cov}(X + Y, Z) = \text{Cov}(X, Z) + \text{Cov}(Y, Z)$

7.  $\text{Cov}(aX + bY, cX + dY) = ac\sigma_X^2 + bd\sigma_Y^2 + (ad + bc)\text{Cov}(X, Y)$

where  $\sigma_X^2 = \text{Cov}(X, X) = \text{var}(X)$  and  $\sigma_Y^2 = \text{Cov}(Y, Y) = \text{var}(Y)$

**49. Show that  $\text{Cov}(aX + b, cY + d) = ac \text{Cov}(X, Y)$** 

**Answer:**

Take  $U = aX + b$  and  $V = cY + d$

Then  $E(U) = aE(X) + b$  and  $E(V) = cE(Y) + d$

$U - E(U) = a[X - E(X)]$  and  $V - E(V) = c[Y - E(Y)]$

$$\begin{aligned} \text{Cov}(aX + b, cY + d) &= \text{Cov}(U, V) = E[\{U - E(U)\} \{V - E(V)\}] = E[a\{X - E(X)\} c\{Y - E(Y)\}] \\ &= ac E[\{X - E(X)\} \{Y - E(Y)\}] = ac \text{Cov}(X, Y) \end{aligned}$$

# Unit III Markov Processes and Markov chains

## 1. Define Random processes and give an example of a random process.

**Answer:**

A Random process is a collection of R.V  $\{X(s,t)\}$  that are functions of a real variable

namely time t where  $s \in S$  and  $t \in T$

**Example:**  $X(t) = A \cos(\omega t + \theta)$  where  $\theta$  is uniformly distributed in  $(0, 2\pi)$  where A and  $\omega$

are constants.

## 2. State the four classifications of Random processes.

**Sol:** The Random processes is classified into four types

### (i) Discrete random sequence

If both T and S are discrete then Random processes is called a discrete Random sequence.

### (ii) Discrete random processes

If T is continuous and S is discrete then Random processes is called a Discrete Random processes.

### (iii) Continuous random sequence

If T is discrete and S is continuous then Random processes is called a Continuous Random sequence.

### (iv) Continuous random processes

If T & S are continuous then Random processes is called a continuous Random processes.

## 3. Define stationary Random processes.

If certain probability distributions or averages do not depend on t, then the random process

$\{X(t)\}$  is called stationary.

## 4. Define first order stationary Random processes.

A random processes  $\{X(t)\}$  is said to be a first order SSS process if  $f(x_1, t_1 + \delta) = f(x_1, t_1)$  (i.e.) the first order density of a stationary process  $\{X(t)\}$  is independent of time t

## 5. Define second order stationary Random processes

A RP  $\{X(t)\}$  is said to be second order SSS if  $f(x_1, x_2, t_1, t_2) = f(x_1, x_2, t_1 + h, t_2 + h)$  where  $f(x_1, x_2, t_1, t_2)$  is the joint PDF of  $\{X(t_1), X(t_2)\}$ .

## 6. Define strict sense stationary Random processes

**Sol:** A RP  $\{X(t)\}$  is called a SSS process if the joint distribution  $X(t_1)X(t_2)X(t_3)\dots X(t_n)$  is the same as that of

$X(t_1 + h)X(t_2 + h)X(t_3 + h)\dots X(t_n + h)$  for all  $t_1, t_2, t_3, \dots, t_n$  and  $h > 0$  and for  $n \geq 1$ .

## 7. Define wide sense stationary Random processes

A RP  $\{X(t)\}$  is called WSS if  $E\{X(t)\}$  is constant and  $E[X(t)X(t + \tau)] = R_{xx}(\tau)$  (i.e.) ACF is a function of  $\tau$  only.

**8. Define jointly strict sense stationary Random processes**

**Sol:** Two real valued Random Processes  $\{X(t)\}$  and  $\{Y(t)\}$  are said to be jointly stationary in the strict sense if the joint distribution of the  $\{X(t)\}$  and  $\{Y(t)\}$  are invariant under translation of time.

**9. Define jointly wide sense stationary Random processes**

**Sol:** Two real valued Random Processes  $\{X(t)\}$  and  $\{Y(t)\}$  are said to be jointly stationary in the wide sense if each process is individually a WSS process and  $R_{XY}(t_1, t_2)$  is a function of  $t_1, t_2$  only.

**10. Define Evolutionary Random processes and give an example.**

**Sol:** A Random processes that is not stationary in any sense is called an Evolutionary process. Example: Poisson process.

**11. If  $\{X(t)\}$  is a WSS with auto correlation  $R(\tau) = Ae^{-\alpha|\tau|}$ , determine the second order moment of the random variable  $X(8) - X(5)$ .**

**Sol:** Given  $R_{xx}(\tau) = Ae^{-\alpha|\tau|}$  (i.e.)  $R_{xx}(t_1, t_2) = Ae^{-\alpha|t_1-t_2|}$

$$(i.e.) E(X(t_1).X(t_2)) = Ae^{-\alpha|t_1-t_2|} \dots\dots\dots (1)$$

$$\therefore E(X^2(t)) = E(X(t)X(t)) = R_{xx}(t, t) = Ae^{-\alpha(0)} = A$$

$$\therefore E(X^2(8)) = A \text{ \& } E(X^2(5)) = A \therefore E(X(8)X(5)) = R_{xx}(8,5) = Ae^{-3\alpha}.$$

Now second order moment of  $\{X(8) - X(5)\}$  is given by

$$\begin{aligned} E(X(8) - X(5))^2 &= E(X^2(8) + X^2(5) - 2X(8)X(5)) \\ &= E(X^2(8)) + E(X^2(5)) - 2E(X(8)X(5)) \\ &= A + A - 2Ae^{-3\alpha} = 2A(1 - e^{-3\alpha}) \end{aligned}$$

**12. Verify whether the sine wave process  $\{X(t)\}$ , where  $X(t) = Y \cos \omega t$  where  $Y$  is uniformly distributed in  $(0,1)$  is a SSS process.**

**Sol:**  $F(x) = P(X(t) \leq x) = P(Y \cos \omega t \leq x)$

$$= \begin{cases} P\left(Y \leq \frac{x}{\cos \omega t}\right) \text{ if } \cos \omega t > 0 \\ P\left(Y \geq \frac{x}{\cos \omega t}\right) \text{ if } \cos \omega t < 0 \end{cases}$$

$$F_X(x) = \begin{cases} F_Y\left(\frac{x}{\cos \omega t}\right) \text{ if } \cos \omega t > 0 \\ 1 - F_Y\left(\frac{x}{\cos \omega t}\right) \text{ if } \cos \omega t < 0 \end{cases}$$

$$\therefore f_{X(t)}(x) = \frac{1}{|\cos \omega t|} f_Y\left(\frac{x}{\cos \omega t}\right) = \text{a function of } t$$

If  $\{X(t)\}$  is to be a SSS process, its first order density must be independent of  $t$ . Therefore,  $\{X(t)\}$  is not a SSS process.

**13. Consider a random variable  $Z(t) = X_1 \cos \omega_0 t - X_2 \sin \omega_0 t$  where  $X_1$  and  $X_2$  are independent Gaussian random variables with zero mean and variance  $\sigma^2$  find  $E(Z)$  and  $E(Z^2)$**

**Sol:** Given  $E(X_1) = 0 = E(X_2)$  &  $Var(X_1) = \sigma^2 = Var(X_2)$

$$\Rightarrow E(X_1^2) = \sigma^2 = E(X_2^2)$$

$$E(Z) = E(X_1 \cos \omega_0 t - X_2 \sin \omega_0 t) = 0$$

$$E(Z^2) = E(X_1 \cos \omega_0 t - X_2 \sin \omega_0 t)^2$$

$$= E(X_1^2) \cos^2 \omega_0 t + E(X_2^2) \sin^2 \omega_0 t - E(X_1 X_2) \cos \omega_0 t \sin \omega_0 t$$

$$= \sigma^2 (\cos^2 \omega_0 t + \sin^2 \omega_0 t) - E(X_1)E(X_2) \cos \omega_0 t \sin \omega_0 t$$

$\because X_1$  &  $X_2$  are independent

$$= \sigma^2 - 0 = \sigma^2.$$

**14. Consider the random process  $X(t) = \cos(\omega_0 t + \theta)$  where  $\theta$  is uniformly distributed in  $(-\pi, \pi)$ . Check whether  $X(t)$  is stationary or not?**

**Answer:**

$$E[X(t)] = \frac{1}{2\pi} \int_{-\pi}^{\pi} \cos(\omega_0 t + \theta) d\theta = \frac{1}{2\pi} [\sin(\omega_0 t + \pi) - \sin(\omega_0 t - \pi)] = \frac{1}{2\pi} [-\sin(\omega_0 t) + \sin(\omega_0 t)] = 0$$

$$E[X^2(t)] = \frac{1}{4\pi} \left[ \frac{\theta - 2 \sin(\omega_0 t + \theta)}{2} \right]_{-\pi}^{\pi} = \frac{1}{2}$$

**15. Define Markov Process.**

**Sol:** If for  $t_1 < t_2 < t_3 < t_4 \dots < t_n < t$  then

$$P(X(t) \leq x / X(t_1) = x_1, X(t_2) = x_2, \dots, X(t_n) = x_n) = P(X(t) \leq x / X(t_n) = x_n)$$

Then the process  $\{X(t)\}$  is called a Markov process.

**16. Define Markov chain.**

**Sol:** A Discrete parameter Markov process is called Markov chain.

**17. Define one step transition probability.**

**Sol:** The one step probability  $P[X_n = a_j / X_{n-1} = a_i]$  is called the one step probability from the state  $a_i$  to  $a_j$  at the  $n^{th}$  step and is denoted by  $P_{ij}(n-1, n)$

**18. The one step tpm of a Markov chain with states 0 and 1 is given as**

$$P = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}. \text{Draw the Transition diagram. Is it Irreducible Markov chain?}$$

**Sol:**

Yes it is irreducible since each state can be reached from any other state

19. Prove that the matrix  $P = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1/2 & 1/2 & 0 \end{bmatrix}$  is the tpm of an irreducible Markov

chain. Sol:  $P^2 = \begin{bmatrix} 0 & 0 & 1 \\ 1/2 & 1/2 & 0 \\ 0 & 1/2 & 1/2 \end{bmatrix}$   $P^3 = \begin{bmatrix} 1/2 & 1/2 & 0 \\ 0 & 1/2 & 1/2 \\ 1/4 & 1/4 & 1/2 \end{bmatrix}$

Here  $P_{11}^{(3)} > 0, P_{13}^{(2)} > 0, P_{21}^{(2)} > 0, P_{22}^{(2)} > 0, P_{33}^{(2)} > 0$  and for all other  $P_{ij}^{(1)} > 0$   
Therefore the chain is irreducible.

**20 State the postulates of a Poisson process.**

Let  $\{X(t)\}$  = number of times an event A say, occurred up to time 't' so that the sequence  $\{X(t)\}, t \geq 0$  forms a Poisson process with parameter  $\lambda$ .

- (i)  $P[1 \text{ occurrence in } (t, t + \Delta t)] = \lambda \Delta t$
- (ii)  $P[0 \text{ occurrence in } (t, t + \Delta t)] = 1 - \lambda \Delta t$
- (iii)  $P[2 \text{ or more occurrence in } (t, t + \Delta t)] = 0$
- (iv)  $X(t)$  is independent of the number of occurrences of the event in any interval prior and after the interval  $(0, t)$ .
- (v) The probability that the event occurs a specified number of times in  $(t_0, t_0 + t)$  depends only on t, but not on  $t_0$ .

**20. State any two properties of Poisson process**

- Sol: (i) The Poisson process is a Markov process  
(ii) Sum of two independent Poisson processes is a Poisson process  
(iii) The difference of two independent Poisson processes is not a Poisson process.

**21. If the customers arrived at a counter in accordance with a Poisson process with a mean rate of 2 per minute, find the probability that the interval between two consecutive arrivals is more than one minute.**

Sol: The interval T between 2 consecutive arrivals follows an exponential distribution with

parameter  $\lambda = 2, P(T > 1) = \int_1^{\infty} 2e^{-2t} dt = e^{-2} = 0.135$ .

**22. A bank receives on an average  $\lambda = 6$  bad checks per day, what are the probabilities that it will receive (i) 4 bad checks on any given day (ii) 10 bad checks over any 2 consecutive days.**

Sol:  $P(X(t) = n) = \frac{e^{-\lambda t} \cdot (\lambda t)^n}{n!} = \frac{e^{-6t} (6t)^n}{n!}, n = 0, 1, 2, \dots$

(i)  $P(X(1) = 4) = \frac{e^{-6} (6)^4}{4!} = 0.1338$

(ii)  $P(X(2) = 10) = \frac{e^{-12} (12)^{10}}{10!} = 0.1048$

**23. Suppose the customers arrive at a bank according to a Poisson process with a mean rate of 3 per minute. Find the probability that during a time interval of 2 minutes exactly 4 customers arrive**

Sol: (i)  $P(X(t) = n) = \frac{e^{-3t} (3t)^n}{n!}, n = 0, 1, 2, \dots$

(ii)  $P(X(2) = 4) = \frac{e^{-6} (6)^4}{4!} = 0.1338.$

**24. Consider a Markov chain with two states and transition probability matrix**

$P = \begin{bmatrix} 3/4 & 1/4 \\ 1/2 & 1/2 \end{bmatrix}$ . Find the stationary probabilities of the chain.

Sol:  $(\pi_1, \pi_2) \begin{bmatrix} 3/4 & 1/4 \\ 1/2 & 1/2 \end{bmatrix} = (\pi_1, \pi_2) \quad \pi_1 + \pi_2 = 1$

$\frac{3}{4}\pi_1 + \frac{\pi_2}{4} = \pi_1 \Rightarrow \frac{\pi_1}{4} - \frac{\pi_2}{2} = 0. \quad \therefore \pi_1 = 2\pi_2$

$\therefore \pi_1 = \frac{2}{3}, \pi_2 = \frac{1}{3}.$

**25. Customers arrive a large store randomly at an average rate of 240 per hour. What is the probability that during a two-minute interval no one will arrive.**

Sol:  $P(X(t) = n) = \frac{e^{-4t} (4t)^n}{n!}, n = 0, 1, 2, \dots$  since  $\lambda = \frac{240}{60} = 4$

$\therefore P(X(2) = 0) = e^{-8} = 0.0003.$

**26. The no of arrivals at the regional computer centre at express service counter between 12 noon and 3 p.m has a Poisson distribution with a mean of 1.2 per minute. Find the probability of no arrivals during a given 1-minute interval.**

Sol:  $P(X(t) = n) = \frac{e^{-1.2t} (1.2t)^n}{n!}, n = 0, 1, 2, \dots$

$P(X(1) = 0) = e^{-1.2} = 0.3012.$

Sol: (i) If a Gaussian process is wide sense stationary, it is also a strict sense stationary.

$R_{yy}(\tau) = \frac{2}{\pi} R_{xx}(0) [\cos \alpha + \alpha \sin \alpha]$  where  $\sin \alpha = \frac{R_{xx}(\tau)}{R_{xx}(0)}$ .

Hence  $\{Y(t)\}$  is wide sense stationary.

Then  $Y(t)$  is called a Hard limiter process or ideal limiter process.

**27. For the sine wave process  $X(t) = Y \cos \omega t, -\infty < t < \infty$  where  $\omega = \text{constant}$ , the amplitude  $Y$  is a random variable with uniform distribution in the interval 0 and 1. check whether the process is stationary or not.**

Sol:  $f(y) = \begin{cases} 1 & 0 < y < 1 \\ 0 & \text{Otherwise} \end{cases}$

$E(X(t)) = \int_0^1 1 \cdot Y \cos \omega t = \cos \omega t \int_0^1 y dy = \cos \omega t.$  (a function of t)

Therefore it is not stationary.

**28. Derive the Auto Correlation of Poisson Process.**

Sol:  $R_{xx}(t_1, t_2) = E[X(t_1)X(t_2)]$

$R_{xx}(t_1, t_2) = E[X(t_1)\{X(t_2) - X(t_1) + X(t_1)\}]$   
 $= E[X(t_1)\{X(t_2) - X(t_1)\}] + E[X^2(t_1)]$   
 $= E[X(t_1)]E[X(t_2) - X(t_1)] + E[X^2(t_1)]$

Since  $X(t)$  is a Poisson process, a process of independent increments.

$\therefore R_{xx}(t_1, t_2) = \lambda t_1 (\lambda t_2 - \lambda t_1) + \lambda_1 t_1 + \lambda_1^2 t_1^2$  if  $t_2 \geq t_1$

$$\Rightarrow R_{xx}(t_1, t_2) = \lambda^2 t_1 t_2 + \lambda t_1 \text{ if } t_2 \geq t_1$$

$$(\text{or}) \Rightarrow R_{xx}(t_1, t_2) = \lambda^2 t_1 t_2 + \lambda \min\{t_1, t_2\}$$

**29. Derive the Auto Covariance of Poisson process**

Sol:  $C(t_1, t_2) = R(t_1, t_2) - E[X(t_1)]E[X(t_2)]$

$$= \lambda^2 t_1 t_2 + \lambda t_1 - \lambda^2 t_1 t_2 = \lambda t_1 \text{ if } t_2 \geq t_1$$

$$\therefore C(t_1, t_2) = \lambda \min\{t_1, t_2\}$$

**30. Define Time averages of Random process.**

Sol: The time averaged mean of a sample function  $X(t)$  of a random process  $\{X(t)\}$  is

defined as  $\overline{X_T} = \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^T X(t) dt$

The time averaged auto correlation of the Random process  $\{X(t)\}$  is defined by

$$\overline{Z_T} = \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^T X(t)X(t+\tau) dt .$$

**31. If  $\{X(t)\}$  is a Gaussian process with  $\mu(t) = 10$  and  $C(t_1, t_2) = 16e^{-|t_1-t_2|}$ , Find  $P\{X(10) \leq 8\}$ .**

**Answer:**  $\mu[X(10)] = 10$  and  $Var[X(10)] = C(10,10) = 16$

$$P[X(10) \leq 8] = P\left[\frac{X(10) - 10}{4} \leq -0.5\right] = P[Z \leq -0.5] = 0.5 - P[Z \leq 0.5] = 0.5 - 0.1915 = 0.3085$$

**32. If  $\{X(t)\}$  is a Gaussian process with  $\mu(t) = 10$  and  $C(t_1, t_2) = 16e^{-|t_1-t_2|}$ , Find the mean and variance of  $X(10) - X(6)$ .**

**Answer:**

$X(10) - X(6)$  is also a normal R.V with mean  $\mu(10) - \mu(6) = 0$  and

$$Var[X(10) - X(6)] = var\{X(10)\} + var\{X(6)\} - 2 cov\{X(10), X(6)\}$$

$$= C(10,10) + C(6,6) - 2C(10,6) = 16 + 16 - 2 \times 16e^{-4} = 31.4139$$

**33. Define a Birth process.**

**Answer:**

A Markov process  $\{X(t)\}$  with state space  $S = \{1, 2, \dots\}$  such that

$$P[X(t+s_i) = k / X(t) = j] = \begin{cases} \lambda_k s_i, & k = j+1, j \geq 1 \\ 1 - \lambda, & s_i k = j \geq 1 \\ 0, & \text{otherwise} \end{cases}$$

is called a birth process where  $\lambda_1, \lambda_2, \dots$  are the constant.

**34. Define Ergodic Random Process.**

Sol: A random process  $\{X(t)\}$  is said to be Ergodic Random Process if its ensemble averages are equal to appropriate time averages.

**35. Define Ergodic state of a Markov chain.**

Sol: A non null persistent and aperiodic state is called an ergodic state.

**36. Define Absorbing state of a Markov chain.**

Sol: A state  $i$  is called an absorbing state if and only if  $P_{ij} = 1$  and  $P_{ij} = 0$  for  $i \neq j$

### 37. Define irreducible

The process is stationary as the first and second moments are independent of time. State any four properties of Autocorrelation function.

Answer:

- i)  $R_{XX}(-\tau) = R_{XX}(\tau)$
- ii)  $|R(\tau)| \leq R(0)$
- iii)  $R(\tau)$  is continuous for all  $\tau$
- iv) if  $R_{XX}(-\tau)$  is AGF of a stationary random process  $\{X(t)\}$  with no periodic components, then  $\mu_X^2 = \lim_{\tau \rightarrow \infty} R(\tau)$

### 38. What do you mean by absorbing Markov chain? Give an example.

Sol: A State I of a Markov chain is said to be an absorbing state if  $P_{ii} = 1$  (i.e.) it is impossible to leave it. A Markov chain is said to be absorbing if it has at least one absorbing state.

Eg: The tpm of an absorbing Markov chain is

$$P = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 1/2 & 0 & 1/2 & 0 \\ 0 & 1/2 & 0 & 1/2 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

### 39. Define Bernoulli Process.

Sol: The Bernoulli random variable is defined as  $X(t_i) = t_i$  which takes two values 0 and 1 with the time index  $t_i$  such that  $\{X(t_i, s) : i = \dots, -1, 0, 1, \dots; s = 0, 1\}$

### 40. State the properties of Bernoulli Process.

- Sol: (i) It is a Discrete process  
(ii) It is a SSS process  
(iii)  $E(X_i) = p, E(X^2) = p$  and  $Var(X_i) = p(1-p)$

### 41. Define Binomial Process

Sol: It is defined as a sequence of partial sums  $\{S_n\}, n = 1, 2, 3, \dots$  where

$$S_n = X_1 + X_2 + \dots + X_n$$

### 42. State the Basic assumptions of Binomial process

Sol: (i) The time is assumed to be divided into unit intervals. Hence it is a discrete time process.

(ii) At most one arrival can occur in any interval

(iii) Arrivals can occur randomly and independently in each interval with probability  $p$ .

### 43. Prove that Binomial process is a Markov process

Sol:  $S_n = X_1 + X_2 + \dots + X_n$

Then  $S_n = S_{n-1} + X_n$

$\therefore P(S_n = m / S_{n-1} = m) = P(X_n = 0) = 1 - p$ .

Also  $P(S_n = m / S_{n-1} = m - 1) = P(X_n = 1) = p$ .

(i.e.) the probability distribution of  $S_n$ , depends only on  $S_{n-1}$ . The process is Markovian process.

### 44. Define Sine wave process.

Sol: A sine wave process is represented as  $X(t) = A \sin(\omega t + \theta)$  where the amplitude  $A$ , or frequency  $\omega$  or phase  $\theta$  or any combination of these three may be

random.

It is also represented as  $X(t) = A \cos(\omega t + \theta)$ .

**45. Prove that sum of two independent Poisson process is also Poisson.**

Sol: Let  $X(t) = X_1(t) + X_2(t)$

$$\begin{aligned} P[X(t) = n] &= \sum_{k=0}^n P[X_1(t) = k]P[X_2(t) = n - k] \\ &= \sum_{k=0}^n \frac{e^{-\lambda_1 t} (\lambda_1 t)^k}{k!} \frac{e^{-\lambda_2 t} (\lambda_2 t)^{n-k}}{(n-k)!} \\ &= \frac{e^{-(\lambda_1 + \lambda_2)t}}{n!} \sum_{k=0}^n \frac{n!}{k!(n-k)!} (\lambda_1 t)^k (\lambda_2 t)^{n-k} \\ &= \frac{e^{-(\lambda_1 + \lambda_2)t}}{n!} (\lambda_1 t + \lambda_2 t)^n \end{aligned}$$

Therefore  $X(t) = X_1(t) + X_2(t)$  is a Poisson process with parameter  $(\lambda_1 + \lambda_2)t$

## Unit IV-Queueing Theory

### 1) What is meant by queue Discipline ?

**Answer:**

It Specifies the manner in which the customers from the queue or equivalently the manner in which they are selected for service, when a queue has been formed. The most common discipline are

- (i) FCFS (First Come First Served) or First In First Out (FIFO)
- (ii) LCFS (Last Come First Served)
- (iii) SIRO (Service in Random Order)

### 2) Define Little's formula

**Answer:**

$$(i) L_s = \lambda W_s \quad (ii) L_q = \lambda W_q \quad (iii) W_s = W_q + \frac{1}{\mu} \quad (iv) L_s = L_q + \frac{\lambda}{\mu}$$

**3) If people arrive to purchase cinema tickets at the average rate of 6 per minute, it takes an average of 7.5 seconds to purchase a ticket. If a person arrives 2 minutes before the picture starts and if it takes exactly 1.5 minutes to reach the correct seat after purchasing the ticket. Can he expect to be seated for the start of the picture ?**

**Answer:**

$$\text{Here } \lambda = 6, \frac{1}{\mu} = \frac{15}{2} \Rightarrow \mu = \frac{2}{15} / \text{sec}$$

$$\therefore \lambda = 6; \quad \mu = \frac{2}{15} \times 60 = 8$$

$$E(L_q) = \frac{1}{\mu - \lambda} = \frac{1}{8 - 6} = \frac{1}{2} \text{ min}$$

He can just be seated for the start of the picture.

$$\therefore E[\text{Total time}] = \frac{1}{2} + \frac{3}{2} = 2 \text{ min}$$

4) If  $\lambda$ ,  $\mu$  are the rates of arrival and departure in a M/M/I queue respectively, give the formula for the probability that there are n customers in the queue at any time in steady state.

Answer:

$$P_n = \left(\frac{\lambda}{\mu}\right)^n \left[1 - \frac{\lambda}{\mu}\right]$$

5) If  $\lambda$ ,  $\mu$  are the rates of arrival and departure respectively in a M/M/I queue, write the formulas for the average waiting time of a customer in the queue and the average number of customers in the queue in the steady state.

Answer:

$$E[N_q] = \frac{\lambda^2}{\mu(\mu - \lambda)}, E[W_q] = \frac{\lambda}{\mu(\mu - \lambda)}$$

6) If the arrival and departure rates in a public telephone booth with a single phone are  $\frac{1}{12}$  and  $\frac{1}{4}$  respectively, find the probability that the phone is busy.

Answer:

$$P[\text{Phone is busy}] = 1 - P[\text{No customer in the booth}]$$

$$= 1 - P_0 = 1 - \left(1 - \frac{\lambda}{\mu}\right) = \frac{\lambda}{\mu} = \frac{1}{12} / \frac{1}{4} = \frac{1}{3}$$

7) If the inter-arrival time and service time in a public telephone booth with a single-phone follow exponential distributions with means of 10 and 8 minutes respectively, Find the average number of callers in the booth at any time.

Answer:

$$L_s = \frac{\lambda}{\mu - \lambda} \text{ Here } \lambda = \frac{1}{10} \text{ and } \mu = \frac{1}{8}$$

$$\therefore \text{Average no. of callers in the booth} = \frac{1/10}{\frac{1}{8} - \frac{1}{10}} = \frac{1}{10} \times \frac{40}{1} = 4$$

8) If the arrival and departure rates in a M/M/I queue are  $\frac{1}{2}$  per minute and  $\frac{2}{3}$  per minute respectively, find the average waiting time of a customer in the queue.

**Answer:**

Average waiting time of a customer in the queue

$$E(W_q) = \frac{\lambda}{\mu(\mu - \lambda)} = \frac{1/2}{\frac{2}{3}\left(\frac{2}{3} - \frac{1}{2}\right)} = 4.5 \text{ min}$$

**9) Customers arrive at a railway ticket counter at the rate of 30/hour. Assuming Poisson arrivals, exponential service time distribution and a single server queue (M/M/I) model, find the average waiting time (before being served) if the average service time is 100 seconds.**

**Answer:**

$$\lambda = 30/\text{hour} \text{ and } \frac{1}{\mu} = 100 \text{ sec} \Rightarrow \frac{1}{\mu} = \frac{1}{36} \text{ hour} \therefore = 36 / \text{hour}$$

Average waiting time in the queue

$$E[W_q] = \frac{\lambda}{\mu(\mu - \lambda)} = \frac{30}{36 \times 6} = \frac{5}{36} \text{ hour} = 8.33 \text{ min}$$

**10) What is the probability that a customer has to wait more than 15 minutes to get his service completed in (M/M/I) : ( $\infty$  / FIFO) queue system if  $\lambda = 6$  per hour and  $\mu = 10$  per hour ?**

**Answer:**

probability that the waiting time of a customer in the system exceeds time  $t = e^{-(\mu - \lambda)t}$

$$\text{Here } \lambda = 6, \mu = 10, t = 15 \text{ min} = \frac{1}{4} \text{ hour}$$

$$\therefore \text{ Required probability} = e^{-(10-6)\frac{1}{4}} = e^{-1} = \frac{1}{e} = 0.3679$$

**11) For (M/M/I) : ( $\infty$  / FIFO) model, write down the Little's formula.**

**Answer:**

$$(i) E(N_s) = \lambda E(W_s) \qquad (ii) E(N_q) = \lambda E(W_q)$$

$$(iii) E(W_s) = E(W_q) + \frac{1}{\mu} \qquad (iv) E(N_s) = E(N_q) + \frac{\lambda}{\mu}$$

12) Using the Little's formula, obtain the average waiting time in the system for M|M|1|N model.

Answer:

By the modified Little's formula,

$$E(W_S) = \frac{1}{\lambda'} E(N_S) \text{ where } \lambda' \text{ is the effective arrival rate.}$$

13) For (M/M/I) : ( $\infty$  / FIFO) model, write down the formula for

- Average number of customers in the queue
- Average waiting time in the system.

Answer:

$$(i) \quad E(W_q) \text{ or } L_q = \frac{P_0(\rho C)^C}{C!(1-\rho)^2} [1 - \rho^{N-C} - (1-\rho)(N-C)\rho^{N-C}]$$

$$\text{Where } \rho = \frac{\lambda}{C\mu} \text{ and } P_0 = \left[ \sum_{n=0}^{C-1} \frac{1}{n!} \left(\frac{\lambda}{\mu}\right)^n + \sum_{n=C}^{\infty} \frac{1}{C^{n-c}} \frac{1}{C!} \left(\frac{\lambda}{\mu}\right)^n \right]^{-1}$$

$$(ii) \quad E(W_s) = \frac{L_s}{\lambda'} \text{ where } \lambda' = \lambda(1-P_N) \text{ or } \mu \left[ C - \sum_{n=0}^{C-1} (C-n)P_n \right]$$

$$\text{and } L_s = L_q + C - \sum_0^{C-1} (C-n)P_n$$

14) What is the probability that a customer has to wait more than 15 minutes to get his service completed in M|M|1 queuing system, if  $\lambda = 6$  per hour and  $\mu = 10$  per hour ?

Answer:

Probability that the waiting time in the system exceeds t is

$$\int_t^{\infty} (\mu - \lambda) e^{-(\mu - \lambda)\varpi} d\varpi = e^{-(\mu - \lambda)t}$$

$$P\left[W_s > \frac{15}{60}\right] = e^{-(10-6)\frac{1}{4}} = e^{-1} = 0.3679$$

15) What is the probability that an arrival to an infinite capacity 3 server Poisson queuing system with  $\frac{\lambda}{\mu} = 2$  and  $p_0 = \frac{1}{9}$  enters the service with out waiting ?

Answer:

$$P[\text{with out waiting}] = P[N < 3] = P_0 + P_1 + P_2$$

$$P_n = \frac{1}{n!} \left( \frac{\lambda}{\mu} \right)^n P_0 \text{ When } n \leq C. \text{ Here } C = 3$$

$$\therefore [N < 3] = \frac{1}{9} + \frac{2}{9} + \frac{1}{2} \times \frac{4}{9} = \frac{5}{9}$$

16) Consider an M|M|1 queuing system. If  $\lambda = 6$  and  $\mu = 8$ , Find the probability of atleast 10 customers in the system.

Answer:

$$P[n \geq 10] = \sum_{n=10}^{\infty} P_n = \sum_{n=10}^{\infty} P_n \left( 1 - \frac{6}{8} \right) \left( \frac{6}{8} \right)^{10} - \left( \frac{6}{8} \right)^{10} = \left( \frac{3}{4} \right)^{10} \quad (k = 9)$$

$$\left[ \text{Probability that the number of customers in the sytem exceeds k, } P(n > K) = \left( \frac{\lambda}{\mu} \right)^{k+1} \right]$$

17) Consider an M|M|C queuing system. Find the probability that an arriving customer is forced to join the queue.

Answer:

$$P[\text{a customer is forced to join queue}] = \sum_{n=c}^{\infty} P_n$$

$$= P_0 \frac{(C\rho)^c}{C!(1-\rho)} = \frac{(C\rho)^c}{C!(1-\rho)} \sum_{n=0}^{c-1} \frac{(C\rho)^n}{n!} + \frac{(C\rho)^c}{C!(1-\rho)} \quad \text{Where } \rho = \frac{\lambda}{C\mu}$$

18) Write down Pollaczek-Khinchine formulae.

Answer:

$$(i) \text{ Average number of customers in the system} = \frac{\lambda^2 \sigma^2 + \rho^2}{2(1-\rho)} + \rho$$

$$(ii) \text{ Average queue length} = \frac{\lambda^2 \sigma^2 + \rho^2}{2(1-\rho)} \quad \text{Where } \rho = \lambda E(T); \sigma^2 = V(T)$$

19) Consider an M|M|1 queueing system. Find the probability of finding atleast 'n' customers in the system.

Answer:

Probability of at least n customers in the system

$$P[N \geq n] = \sum_{K=n}^{\infty} P_k = \sum_{K=n}^{\infty} \left(\frac{\lambda}{\mu}\right)^k \left(1 - \frac{\lambda}{\mu}\right)$$

$$\left(1 - \frac{\lambda}{\mu}\right) \left(\frac{\lambda}{\mu}\right)^n \sum_{k=n}^{\infty} \left(\frac{\lambda}{\mu}\right)^{k-n} = \left(\frac{\lambda}{\mu}\right)^n \left[1 - \frac{\lambda}{\mu}\right] \left[1 - \frac{\lambda}{\mu}\right]^{-1} = \left(\frac{\lambda}{\mu}\right)^n$$

20) Consider an M|M|C queueing system. Find the probability that an arriving customer is forced to join the queue.

Answer:

$$P[N \geq C] = \sum_{n=c}^{\infty} P_n = \sum_{n=c}^{\infty} \frac{1}{C! C^{n-c}} \left(\frac{\lambda}{\mu}\right)^n P_0$$

$$\frac{1}{C!} \left(\frac{\lambda}{\mu}\right)^c P_0 \sum_{n=c}^{\infty} \left(\frac{\lambda}{C\mu}\right)^{n-c} = \frac{\left(\frac{\lambda}{\mu}\right)^c P_0}{C! \left(1 - \frac{\lambda}{C\mu}\right)}$$

21) Briefly describe the M|G|1 queueing system.

Answer:

Poisson arrival / General service / Single server queueing system.

22) Arrivals at a telephone booth are considered to be Poisson with an average time of 12 minutes between one arrival and the next. The length of a phone call is assumed to be exponentially distributed with mean 4 min. What is the probability that it will take him more than 10 minutes altogether to wait for the phone and complete his call ?

Answer:

$$\frac{1}{\lambda} = 12 \text{ min}; \quad \mu = \frac{1}{4} \text{ min},$$

$$P(\varpi > 10) = e^{-(\mu-\lambda)10} = e^{\left(\frac{1}{4} - \frac{1}{12}\right)10} = e^{-5/3} = 0.1889$$

**23) Customers arrive at a one-man barber shop according to a Poisson process with mean inter-arrival time of 12 minute, Customers spend an average of 10 min in the barber's chair. What is the expected number of customers in the barber shop and in the queene ? How much time can a customer expect to spend in the barber's shop ?**

**Answer:**

$$E(N_s) = \frac{\lambda}{\mu - \lambda} \frac{1/12}{\frac{1}{10} - \frac{1}{12}} = 5 \text{ Customers}$$

$$E(N_q) = \frac{\lambda^2}{\mu(\mu - \lambda)} \frac{1/144}{\frac{1}{10} \left( \frac{1}{10} - \frac{1}{12} \right)} = 4.17 \text{ Customers}$$

$$E[\omega] = \frac{1}{\mu - \lambda} \frac{1}{\frac{1}{10} - \frac{1}{12}} = 60 \text{ min or 1 hour}$$

**24) A duplication machine maintained for office use is operated by office assistant. The time to complete each job varies according to an exponential distribution with mean 6 min. Assume a Poisson input with an average arrival rate of 5 jobs per hour. If an 8-hour day is used as a base, determine**

- a) The percentage of idle time of the machine.**
- b) The average time a job is in the system.**

**Answer:**

$$\lambda = 5 / \text{hour}; \mu = \frac{60}{6} 10/ \text{hour}$$

$$(i) P[\text{the machine is idle}] = P_0 = 1 - \frac{\lambda}{\mu} = 1 - \frac{5}{10} = \frac{1}{2} = 50\%$$

$$(ii) E(\omega) = \frac{1}{\mu - \lambda} = \frac{1}{10 - 5} = \frac{1}{5} \text{ hours or 12 min}$$

**25 ) In a (M|M|1):(\infty/F1F0) queuing model, the arrival and service rates are  $\lambda = 12/ \text{hour}$  and  $\mu = 24/\text{hour}$ , find the average number of customers in the system and in the queue.**

**Answer:**

$$E(N_s) = \frac{\lambda}{\mu - \lambda} = \frac{12}{24 - 12} = 1 \text{ customer}$$

$$E(N_q) = \frac{\lambda^2}{\mu(\mu - \lambda)} = \frac{144}{24 \times 12} = \frac{1}{2} \text{ customer}$$

26) Customers arrive at a one-man barber shop according to a Poisson process with a mean inter arrival time of 12 minute. Customers spend an average of 10 minutes in the barber's chair, what is the probability that more than 3 customers are in the system ?

Answer:

$$\begin{aligned}
 P [N > 3] &= P_4 + P_5 + P_6 + \dots \\
 &= 1 - [P_0 + P_1 + P_2 + P_3] = 1 - \left(1 - \frac{\lambda}{\mu}\right) \left[1 + \left(\frac{\lambda}{\mu}\right) + \left(\frac{\lambda}{\mu}\right)^2 + \left(\frac{\lambda}{\mu}\right)^3\right] \\
 \left(\frac{\lambda}{\mu}\right)^4 &= \left(\frac{5}{6}\right)^4 = 0.4823 \quad \text{Since } \lambda = \frac{1}{2} \text{ \& } \mu = \frac{1}{10}
 \end{aligned}$$

27) If a customer has to wait in a (M|M|1):(∞/F1F0) queue system what is his average waiting time in the queue, if λ = 8 per hour and μ=12 per hour ?

Answer:

Average waiting time of a customer in the queue, if he has to wait.

$$= \frac{1}{\mu - \lambda} = \frac{1}{12 - 8} = \frac{1}{4} \text{ hours (or) 15 min}$$

28) What is the probability that a customer has to wait more than 15 minutes to get his service completed in (M|M|1):(∞/F1F0) queue system, if λ = 6 per hour and μ = 10 per hour.

Answer:

$$\text{Required probability} = e^{-(\mu-\lambda)t} = e^{-(10-6)\frac{1}{4}} = e^{-1} = 0.3679$$

29) If there are two servers in an infinite capacity Poisson queue system with λ=10 and μ=15 per hour, what is the percentage of idle time for each server ?

Answer:

$$P [\text{the server will be idle}] = P_0$$

$$P_0 = \frac{1}{\sum_{n=0}^{\infty} \frac{1}{n!} \left(\frac{2}{3}\right)^n + 2! \left(1 - \frac{1}{3}\right)^2} = \frac{1}{1 + \frac{2}{3} + \frac{1}{3}} = \frac{1}{2}$$

∴ Percentage of idle time for each server = 50%

30) If λ = 4 per hour and μ = 12 per hour in an (M|M|1):(∞/F1F0) queuing system, find the probability that there is no customer in the system.

Answer:

$$P_0 = \frac{1 - \frac{\lambda}{\mu}}{1 - \left(\frac{\lambda}{\mu}\right)^{k+1}} = \frac{1 - \frac{1}{3}}{1 - \left(\frac{1}{3}\right)^5} = \frac{\frac{2}{3}}{1 - \frac{1}{243}} = \frac{2}{3} \times \frac{243}{242} = \frac{81}{121}$$

# UNIT-V Non- Markovian Queues and Queue Networks

1. Write down pollaczek-Khintchine formula and explain the notations .

If  $T$  is the random service time, the average number of customers in the system

$$L_s = E_n = \lambda E(T) + \frac{\lambda^2 [E^2(T) + V(T)]}{2[1 - \lambda E(T)]}, \text{ where } E(T) \text{ is mean of } T \text{ and } V(T) \text{ is variance of } T.$$

**M/G/1 queueing system is markovian comment on this statement.**

M/G/1 queueing system is a non markovian queue model. Since the service time follows general distribution.

2. What do you mean by regeneration points in ( M/G/1 ) model?

The point at which the nth units completes his service and leaves the system.

3. Write down pollaczek-Khintchine transform formula.

$$V(s) = \frac{(1 - \rho)(1 - s)B^*(\lambda - \lambda_s)}{B^*(\lambda - \lambda_s) - s}$$

4. In ( M/G/1 ) model write the formula for the average in the system.

$$W_s = \frac{\lambda^2 \sigma^2 + \rho^2}{2\lambda(1 - \rho)} + \frac{1}{\mu}$$

Queue Networks

5. Write classification of Queueing Networks.

- Open Networks
- Closed Networks
- Mixed Network

**7.State arrival theorem .**

In the closed networks system with  $m$  customers, the system as seen by arrivals to server  $j$  is distributed as the stationary distribution in the same network system when there are only  $m-1$  customers.

**8. Distinguish between open and closed network.**

Open Networks	Closed Networks
<p>1. Arrivals from outside to the node <math>i(r_i)</math> is allowed.</p> <p>2. Once the customer gets the service completed at node <math>i</math>, he joins the queue at node <math>j</math> with probability <math>p_{ij}</math> or leaves the system with probability <math>p_{i0}</math></p>	<p>1. New customer never enter in to the system.</p> <p>2. Existing customer never depart from the system (ie) <math>p_{i0} = 0</math> and <math>r_i = 0</math> or all I (OR) No c customer may leave the system.</p>

9. Explain (series queue) tandem queue model.

A series queue or a tandem queue model is satisfies the following characteristics.

- Customers may arrive from outside the system at any node and may leave the system from any node.
- Customers may enter the system at some node, traverse from node to node in the system and leave the system from some node, necessarily following the same order of nodes.
- Customers may return to the nodes already visited, skip some nodes and even choose to remain in the system for ever.

#### 10. Define an open Jackson network.

Suppose a queueing network consists of k nodes is called an open Jackson network, if it satisfies the following characteristics.

- Customers arriving at node k from outside the system arrive in a Poission pattern with the average arrival rate  $r_i$  and join the queue at I and wait for his turn for service.
- Service times at the channels at node I are independent and each exponentially distributed wite parameter  $\mu$ .
- Once a customer gets the service completed at node i, he joins the queue at node j with probability  $p_{ij}$  ( whatever be the number of customers waiting at j for service), when  $i = 1,2,\dots,k$  and  $j = 1,2,\dots,k$   $p_{i0}$  represents the probability that a customer leaves the system from the i after getting the service at i
- The utilization of all the queue is less than one.

#### 11. Define a closed Jackson network.

A queueing network of k nodes is called a closed Jackson network, if new customer never enter into and the existing customer never depart from the system. Viz. if  $r_i = 0$  and  $p_{i0}$  for all i. In other words, it is equivalent to a finite source queueing system of N customers who traverse continuously inside the network where the service i is exponentially distributed with rate  $\mu_i$ ,  $I=1,2,\dots,k$

The customer completes the service at  $S_j, j= 1,2,\dots,k$  with probability  $p_{ij}$  where it is assumed that  $\sum_{j=1}^k p_{ij} = 1$  for all  $I = 1,2,\dots,k$

#### 12. What is meant by queue network?

A network of queues is a collection of service centers, which represent system resources, and customers, which represent users or transactions.

#### 13. What do you mean by M/G/1 queue.

In the M/G/1 Queueing system under study, we consider a single-server queueing system with infinite capacity, poission arrivals and general service discipli8ne. The model has arbitrary service time, and it is not necessary to be memoryless. Ie .it is not exponential.

#### 14. Write down the formula for the steady-state probability $P(n_1, n_2, \dots, n_k)$ for multiple server Jackson's closed network.

$$P(n_1, n_2, \dots, n_k) = C_N \frac{\rho_1^{n_1}}{a_1(n_1)} \frac{\rho_2^{n_2}}{a_2(n_2)} \dots \frac{\rho_k^{n_k}}{a_k(n_k)}$$

$$\text{Where } C_N^{-1} = \sum_{n_1+n_2+\dots+n_k=N} \frac{\rho_1^{n_1}}{a_1(n_1)} \frac{\rho_2^{n_2}}{a_2(n_2)} \dots \frac{\rho_k^{n_k}}{a_k(n_k)}$$

Reg. No. : [REDACTED]

**Question Paper Code : 21524**

B.E./B.Tech. DEGREE EXAMINATION, MAY/JUNE 2013.

Fourth Semester

Computer Science and Engineering

MA 2262/MA 44/MA 1252/10177 PQ 401/080250008 — PROBABILITY AND  
QUEUEING THEORY

(Common to Information Technology)

(Regulation 2008/2010)

Time : Three hours

Maximum : 100 marks

Answer ALL questions.

PART A — (10 × 2 = 20 marks)

1. If  $X$  and  $Y$  are two independent random variables with variances 2 and 3, find the variance of  $3X + 4Y$ .
2. State memory less property of exponential distribution.
3. If the joint pdf of  $(X, Y)$  is given by  $f(x, y) = 2$ , in  $0 \leq x < y \leq 1$ , find  $E(X)$ .
4. State Central limit theorem.
5. Define wide sense stationary process.
6. If the transition probability matrix (tpm) of a Markov chain is  $\begin{pmatrix} 0 & 1 \\ \frac{1}{2} & \frac{1}{2} \end{pmatrix}$ , find the steady state distribution of the chain.
7. What are the characteristics of a queuing system?
8. What is the probability that a customer has to wait more than 15 minutes to get his service completed in a M/M/1 queuing system, if  $\lambda = 6$  per hour and  $\mu = 10$  per hour?
9. State Pollaczek-Khinchine formula.
10. Define closed network of a queuing system.

PART B — (5 × 16 = 80 marks)

11. (a) (i) A continuous random variable has the pdf  $f(x) = kx^4, -1 < x < 0$ .  
Find the value of  $k$  and also  $P\left\{X > \left(-\frac{1}{2}\right) / X < \left(-\frac{1}{4}\right)\right\}$ . (8)
- (ii) Find the moment generating function of Uniform distribution.  
Hence find its mean and variance. (8)

Or

- (b) (i) Find the moment generating function and  $r^{\text{th}}$  moment for the distribution whose pdf is  $f(x) = Ke^{-x}, 0 \leq x < \infty$ . Hence find the mean and variance. (8)
- (ii) In a large consignment of electric bulbs, 10 percent are defective. A random sample of 20 is taken for inspection. Find the probability that (1) all are good bulbs (2) at most there are 3 defective bulbs (3) exactly there are 3 defective bulbs. (8)
12. (a) (i) The joint probability density function of a two-dimensional random variable  $(X, Y)$  is  $f(x, y) = \frac{1}{8}(6 - x - y), 0 < x < 2, 2 < y < 4$ .  
Find (1)  $P(X < 1 \cap Y < 3)$  (2)  $P(X + Y < 3)$  (3)  $P(X < 1 / Y < 3)$ . (8)
- (ii) If  $X$  and  $Y$  each follow an exponential distribution with parameter  $\lambda$  and are independent, find the pdf of  $U = X - Y$ . (8)

Or

- (b) (i) The marks obtained by 10 students in Mathematics and Statistics are given below. Find the correlation coefficient between the two subjects. (8)

Marks in mathematics	75	30	60	80	53	35	15	40	38	48
Marks in statistics	85	45	54	91	58	63	35	43	45	44

- (ii) A distribution with unknown mean  $\mu$  has variance equal to 1.5. Use central limit theorem to find how large a sample should be taken from the distribution in order that the probability will be at least 0.95 that the sample mean will be within 0.5 of the population mean. (8)
13. (a) (i) Show that the process  $X(t) = A \cos \lambda t + B \sin \lambda t$  is wide sense stationary, if  $E(A) = E(B) = 0, E(A^2) = E(B^2)$  and  $E(AB) = 0$ , where  $A$  and  $B$  are random variables. (8)
- (ii) A gambler has Rs 2. He bets Re. 1 at a time and wins Re. 1 with probability  $\frac{1}{2}$ . He stops playing if he loses Rs. 2 or wins Rs. 4. (1) What is the tpm of the related Markov chain? (2) What is the probability that he has lost his money at the end of 5 plays? (8)

Or

- (b) (i) Find the nature of the states of the Markov chain with the tpm

$$P = \begin{bmatrix} 0 & 1 & 0 \\ \frac{1}{2} & 0 & \frac{1}{2} \\ 0 & 1 & 0 \end{bmatrix} \quad (8)$$

- (ii) Prove that the difference of two independent Poisson processes is not a Poisson process. (4)

- (iii) Prove that the Poisson process is a Markov Process. (4)

14. (a) (i) Derive (1)  $L_s$ , average number of customers in the system (2)  $L_q$ , average number of customers in the queue for the queuing model (M/M/1): (N/FIFO). (8)

- (ii) There are three typists in an office. Each typist can type an average of 6 letters per hour. If letters arrive for being typed at the rate of 15 letters per hour, what fraction of time all the typists will be busy? What is the average number of letters waiting to be typed? (Assume Poisson arrivals and exponential service times) (8)

Or

- (b) Customers arrive at a one man barber shop according to a Poisson process with a mean inter arrival time of 20 minutes. Customers spend an average of 15 minutes in the barber chair. The service time is exponentially distributed. If an hour is used as a unit of time, then

- (i) What is the probability that a customer need not wait for a hair cut?

- (ii) What is the expected number of customer in the barber shop and in the queue?

- (iii) How much time can a customer expect to spend in the barber shop?

- (iv) Find the average time that a customer spend in the queue.

- (v) Estimate the fraction of the day that the customer will be idle?

- (vi) What is the probability that there will be 6 or more customers?

- (vii) Estimate the percentage of customers who have to wait prior to getting into the barber's chair. (16)

15. (a) Automatic car wash facility operates with only one bay. Cars arrive according to a Poisson process at the rate of 4 cars per hour and may wait in the facility's parking lot if the bay is busy. The service time for all cars is constant and equal to 10 minutes. Determine  $L_s, L_q, W_s$  and  $W_q$ . (16)

Or

- (b) Consider a system of two servers where customers from outside the system arrive at server 1 at a Poisson rate 4 and at server 2 at a Poisson rate 5. The service rates for server 1 and 2 are 8 and 10 respectively. A customer upon completion of service at server 1 is likely to go to server 2 or leave the system; whereas a departure from server 2 will go 25 percent of the time to server 1 and will depart the system otherwise. Determine the limiting probabilities,  $L_s$  and  $W_s$ . (16)

**Question Paper Code : 53187**

B.E./B.Tech. DEGREE EXAMINATION, NOVEMBER/DECEMBER 2010

Fourth Semester

Computer Science and Engineering

MA 2262 — PROBABILITY AND QUEUEING THEORY

(Common to Information Technology)

(Regulation 2008)

(Normal tables be permitted in the examination Hall)

Time : Three hours

Maximum : 100 Marks

Answer ALL questions

PART A — (10 × 2 = 20 Marks)

1. If a random variable  $X$  has the distribution function  $F(X) = \begin{cases} 1 - e^{-\alpha x} & \text{for } x > 0 \\ 0 & \text{for } x \leq 0, \end{cases}$  where  $\alpha$  is the parameter, then find  $P(1 \leq X \leq 2)$ .
2. Every week the average number of wrong-number phone calls received by a certain mail order house is seven. What is the probability that they will receive two wrong calls tomorrow?
3. If there is no linear correlation between two random variables  $X$  and  $Y$ , then what can you say about the regression lines?
4. Let the joint pdf of the random variable  $(X, Y)$  be given by  $f(x, y) = 4xye^{-(x^2+y^2)}$ ;  $x > 0$  and  $y > 0$ . Are  $X$  and  $Y$  independent? Why or why not?
5. Examine whether the Poisson process  $\{x(t)\}$  is stationary or not.
6. When is a Markov chain, called homogeneous?
7. Arrivals at a telephone booth are considered to be Poisson with an average time of 12 mins between one arrival and the next. The length of a phone call is assumed to be distributed exponentially with mean 4 mins. Find the average number of persons waiting in the system.
8. Draw the state transition rate diagram of an M/M/c queueing model.
9. What do you mean by bottleneck of a network?
10. Consider a service facility with two sequential stations with respective service rates of 3/min and 4/min. The arrival rate is 2/min. What is the average service time of the system, if the system could be approximated by a two stage Tandem queue?

PART B — (5 × 16 = 80 Marks)

11. (a) (i) The distribution function of a random variable  $X$  is given by  $F(X) = 1 - (1+x)e^{-x}$ ;  $x \geq 0$ . Find the density function, mean and variance of  $X$ . (8)
- (ii) A coin is tossed until the first head occurs. Assuming that the tosses are independent and the probability of a head occurring is ' $p$ '. Find the value of ' $p$ ' so that the probability that an odd number of tosses required is equal to 0.6. Can you find a value of ' $p$ ' so that the probability is 0.5 that an odd number of tosses are required? (8)

Or

- (b) (i) If  $X$  is a random variable with a continuous distribution function  $F(X)$ , prove that  $Y = F(X)$  has a uniform distribution in  $(0,1)$ .

Further if  $f(X) = \begin{cases} \frac{1}{2}(x-1); & 1 \leq x \leq 3 \\ 0; & \text{otherwise} \end{cases}$ , find the range of

$Y$  corresponding to the range  $1.1 \leq x \leq 2.9$ . (8)

- (ii) The time (in hours) required to repair a machine is exponentially distributed with parameter  $\lambda = \frac{1}{2}$ .

What is the probability that the repair time exceeds  $2h$ ? What is the conditional probability that a repair takes at least  $10h$  given that its duration exceeds  $9h$ ? (8)

12. (a) (i) Given  $f(x,y) = cx(x-y)$ ,  $0 < x < 2$ ,  $-x < y < x$  and '0' elsewhere. Evaluate ' $c$ ' and find  $f_x(x)$  and  $f_y(y)$ . (8)
- (ii) Compute the coefficient of correlation between  $X$  and  $Y$  using the following data: (8)

$X$ : 1 3 5 7 8 10  
 $Y$ : 8 12 15 17 18 20

Or

- (b) (i) For two random variables  $X$  and  $Y$  with the same mean, the two regression equations are  $y = ax + b$  and  $x = cy + d$ . Find the common mean, ratio of the standard deviations and also show that  $\frac{b}{d} = \frac{1-a}{1-c}$ . (8)

- (ii) If  $X_1, X_2, \dots, X_n$  are Poisson variates with parameter  $\lambda = 2$ , use the central limit theorem to estimate  $P(120 \leq S_n \leq 160)$ , where  $S_n = X_1 + X_2 + \dots + X_n$  and  $n = 75$ . (8)

13. (a) (i) If customers arrive at a counter in accordance with a Poisson process with a mean rate of 2/min, find the probability that the interval between 2 consecutive arrivals is more than 1 min, between 1 and 2 mins, and 4 mins or less. (8)
- (ii) An engineer analysing a series of digital signals generated by a testing system observes that only 1 out of 15 highly distorted signals follow a highly distorted signal, with no recognisable signal between, whereas 20 out of 23 recognisable signals follow recognisable signals, with no highly distorted signal between. Given

that only highly distorted signals are not recognizable, find the fraction of signals that are highly distorted. (8)

Or

- (b) (i) Suppose that a mouse is moving inside the maze shown in the adjacent figure from one cell to another, in search of food. When at a cell, the mouse will move to one of the adjoining cells randomly. For  $n \geq 0$ ,  $X_n$  be the cell number the mouse will visit after having changed cells 'n' times. Is  $\{X_n; n = 0, 1, \dots\}$  a Markov chain? If so, write its state space and transition probability matrix. (8)

1	4	7
2	5	8
3	6	9

- (ii) The following is the transition probability matrix of a Markov chain with state space  $\{0, 1, 2, 3, 4\}$ . Specify the classes, and determine which classes are transient and which are recurrent. Give reasons. (8)

$$P = \begin{pmatrix} 2/5 & 0 & 0 & 3/5 & 0 \\ 1/3 & 1/3 & 0 & 1/3 & 0 \\ 0 & 0 & 1/2 & 0 & 1/2 \\ 1/4 & 0 & 0 & 3/4 & 0 \\ 0 & 0 & 1/3 & 0 & 2/3 \end{pmatrix}$$

14. (a) If people arrive to purchase cinema tickets at the average rate of 6 per minute, it takes an average of 7.5 seconds to purchase a ticket. If a person arrives 2 min before the picture starts and it takes exactly 1.5 min to reach the correct seat after purchasing the ticket.
- Can he expect to be seated for the start of the picture?
  - What is the probability that he will be seated for the start of the picture?
  - How early must he arrive in order to be 99% sure of being seated for the start of the picture? (16)

Or

- (b) There are 3 typists in an office. Each typist can type an average of 6 letters per hour. If letters arrive for being typed at the rate of 15 letters per hour.
- What fraction of the time all the typists will be busy?
  - What is the average number of letters waiting to be typed?
  - What is the average time a letter has to spend for waiting and for being typed?

15. (a) Derive Pollaczek-Khinchin formula of M/G/1 queue. (16)

Or

- (b) Write short notes on the following :
- Queue networks (4)
  - Series queues (4)
  - Open networks (4)
  - Closed networks. (4)

B.E./B.Tech. DEGREE EXAMINATION, APRIL/MAY 2011

Fourth Semester

Computer Science and Engineering

MA 2262 — PROBABILITY AND QUEUEING THEORY

(Common to B.Tech. Information Technology)

(Regulation 2008)

Time : Three hours

Maximum : 100 marks

Answer ALL questions

PART A — (10 × 2 = 20 marks)

1. The cumulative distribution function of the random variable  $X$  is given by

$$F_X(x) = \begin{cases} 0 & , \quad x < 0 \\ x + \frac{1}{2} & , \quad 0 \leq x \leq \frac{1}{2} \\ 1 & , \quad x > \frac{1}{2} \end{cases}$$

Compute  $P[X > 1/4]$ .

2. Let the random variable  $X$  denote the sum obtained in rolling a pair of fair dice. Determine the probability mass function of  $X$ .
3. Given the two regression lines  $3X + 12Y = 19$ ,  $3Y + 9X = 46$ , find the coefficient of correlation between  $X$  and  $Y$ .
4. State central limit theorem.
5. Define :
- (a) Continuous-time random process
  - (b) Discrete state random process.

6. Find the transition probability matrix of the process represented by the state transition diagram

7. Arrival rate of telephone calls at a telephone booth is according to Poisson distribution with an average time of 9 minutes between two consecutive arrivals. The length of a telephone call is assumed to be exponentially distributed with mean 3 minutes. Determine the probability that a person arriving at the booth will have to wait.
8. Trains arrive at the yard every 15 minutes and the service time is 33 minutes. If the line capacity of the yard is limited to 4 trains find the probability that the yard is empty.
9. Given that the service time is Erlang with parameters  $m$  and  $\mu$ . Show that the Pollaczek-Khintchine formula reduces to  $L_s = m\rho + \frac{m(1+m)\rho^2}{2(1-m\rho)}$ .
10. Give any two examples for series queuing situations.

PART B — (5 × 16 = 80 marks)

11. (a) (i) Find the moment-generating function of the binomial random variable with parameters  $m$  and  $p$  and hence find its mean and variance. (10)
- (ii) Define Weibull distribution and write its mean and variance. (6)

Or

- (b) (i) Derive mean and variance of a Geometric distribution. Also establish the forgetfulness property of the Geometric distribution. (8)
- (ii) Suppose that telephone calls arriving at a particular switchboard follow a Poisson process with an average of 5 calls

coming per minute. What is the probability that up to a minute will elapse unit 2 calls have come in to the switch board? (8)

12. (a) Given the joint density function

$$f(x, y) = \begin{cases} x \frac{(1+3y^2)}{4}, & 0 < x < 2, 0 < y < 1 \\ 0, & \text{elsewhere} \end{cases}$$

Find the marginal densities  $g(x), h(y)$  and the conditional density  $f(x/y)$  and evaluate  $P\left[\frac{1}{4} < x < \frac{1}{2} / Y = 1/3\right]$ .

Or

- (b) (i) Determine whether the random variables  $X$  and  $Y$  are independent, given their joint probability density function as (8)

$$f(x, y) = \begin{cases} x^2 + \frac{xy}{3}, & 0 \leq x \leq 1, 0 \leq y \leq 2 \\ 0, & \text{otherwise} \end{cases}$$

- (ii) If  $X$  and  $Y$  are independent random variables having density functions

$$f(x) = \begin{cases} 2e^{-2x}, & x \geq 0 \text{ and} \\ 0, & x < 0 \end{cases}$$

$$f(y) = \begin{cases} 3e^{-3y}, & y \geq 0 \\ 0, & y < 0 \end{cases}$$

respectively, find the density functions of  $z = X - Y$ . (8)

13. (a) (i) Show that random process  $\{X(t)\} = A \cos t + B \sin t, -\infty < t < \infty$  is a wide sense stationary process where  $A$  and  $B$  are independent random variables each of which has a value  $-2$  with probability  $\frac{1}{3}$  and a value  $1$  with probability  $2/3$ . (8)

- (ii) Derive probability distribution of Poisson process and hence find its auto correlation function. (8)

Or

- (b) (i) Find the limiting-state probabilities associated with the following transition probability matrix.

$$\begin{bmatrix} 0.4 & 0.5 & 0.1 \\ 0.3 & 0.3 & 0.4 \\ 0.3 & 0.2 & 0.5 \end{bmatrix}. \quad (10)$$

- (ii) Show that the difference of two independent Poisson processes is not a Poisson process. (6)
14. (a) (i) Customers arrive at a one window drive-in bank according to Poisson distribution with mean 10 per hour. Service time per customer is exponential with mean 5 minutes. The space is front of window, including that for the serviced car can accommodate a maximum of three cars. Others cars can wait outside this space.
- (1) What is the probability that an arriving customer can drive directly to the space in front of the window?
  - (2) What is the probability that an arriving customer will have to wait outside the indicated space?
  - (3) How long is an arriving customer expected to wait before being served? (10)
- (ii) Show that for the  $(M/M/1):(FCFS/\infty/\infty)$ , the distribution of waiting time in the system is  $w(t) = (\mu - \lambda)e^{-(\mu - \lambda)t}, t > 0$ . (6)
- Or
- (b) Find the steady state solution for the multiserver  $M/M/C$  model and hence find  $L_9, W_9, W_s$  and  $L_s$  by using Little's formula.
15. (a) Derive the expected steady state system size for the single server queues with Poisson input and General service. (16)
- Or
- (b) Write short notes on :
- (i) Series Queues. (8)
  - (ii) Open and Closed Queue Networks. (8)

Reg. No. :

**Question Paper Code: E3123**

B.E./B.Tech. DEGREE EXAMINATION, APRIL/MAY 2010

Fourth Semester

Computer Science and Engineering

MA2262 — PROBABILITY AND QUEUEING THEORY

(Regulation 2008)

(Common to Information Technology)

Time: Three hours

Maximum: 100 Marks

Answer ALL Questions

PART A — (10 × 2 = 20 Marks)

1. Obtain the mean for a Geometric random variable.
2. What is meant by memoryless property? Which continuous distribution follows this property?
3. Give a real life example each for positive correlation and negative correlation.
4. State central limit theorem for independent and identically distributed (*iid*) random variables.
5. Is a Poisson process a continuous time Markov chain? Justify your answer.
6. Consider the Markov chain consisting of the three states 0, 1, 2 and transition

probability matrix  $P = \begin{vmatrix} \frac{1}{2} & \frac{1}{2} & 0 \\ \frac{1}{2} & \frac{1}{4} & \frac{1}{4} \\ 0 & \frac{1}{3} & \frac{2}{3} \end{vmatrix}$  it irreducible? Justify.

7. Suppose that customers arrive at a Poisson rate of one per every 12 minutes and that the service time is exponential at a rate of one service per 8 minutes. What is the average number of customers in the system?

8. Define M/M/2 queueing model. Why the notation M is used?
9. Distinguish between open and closed networks.
10. M/G/1 queueing system is Markovian. Comment on this statement.

PART B — (5 × 16 = 80 Marks)

11. (a) (i) By calculating the moment generating function of Poisson distribution with parameter  $\lambda$ , prove that the mean and variance of the Poisson distribution are equal.
- (ii) If the density function of  $X$  equals  $f(x) = \begin{cases} Ce^{-2x}, & 0 < x < \infty \\ 0, & x < 0 \end{cases}$ , find  $C$ .  
What is  $P[X > 2]$ ?

Or

- (b) (i) Describe the situations in which geometric distributions could be used. Obtain its moment generating function.
- (ii) A coin having probability  $p$  of coming up heads is successively flipped until the  $r^{\text{th}}$  head appears. Argue that  $X$ , the number of flips required will be  $n$ ,  $n \geq r$  with probability

$$P[X = n] = \binom{n-1}{r-1} p^r q^{n-r} \quad n \geq r$$

12. (a) (i) Suppose that  $X$  and  $Y$  are independent non negative continuous random variables having densities  $f_X(x)$  and  $f_Y(y)$  respectively. Compute  $P[X < Y]$ .
- (ii) The joint density of  $X$  and  $Y$  is given by  $f(x, y) = \begin{cases} \frac{1}{2} ye^{-xy}, & 0 < x < \infty, 0 < y < 2 \\ 0, & \text{otherwise} \end{cases}$ . Calculate the conditional density of  $X$  given  $Y = 1$ .

Or

- (b) (i) If the correlation coefficient is 0, then can we conclude that they are independent? Justify your answer, through an example. What about the converse?
- (ii) Let  $X$  and  $Y$  be independent random variables both uniformly distributed on  $(0,1)$ . Calculate the probability density of  $X + Y$ .

13. (a) (i) Let the Markov Chain consisting of the states 0,1,2,3 have the transition probability matrix.

$$P = \begin{vmatrix} 0 & 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{vmatrix}$$

Determine which states are transient and which are recurrent by defining transient and recurrent states.

- (ii) Suppose that whether or not it rains today depends on previous weather conditions through the last two days. Show how this system may be analyzed by using a Markov chain. How many states are needed?

Or

- (b) (i) Derive Chapman-Kolmogorov equations.
- (ii) Three out of every four trucks on the road are followed by a car, while only one out of every five cars is followed by a truck. What fraction of vehicles on the road are trucks?
14. (a) Define birth and death process. Obtain its steady state probabilities. How it could be used to find the steady state solution for the M/M/1 model? Why is it called geometric?

Or

- (b) Calculate any four measures of effectiveness of M/M/1 queueing model.
15. (a) Derive Pollaczek-Khintchine formula.

Or

- (b) Explain how queueing theory could be used to study computer networks.
-

PART A — (10 × 2 = 20 Marks)

1. If a random variable  $X$  has the distribution function  $F(X) = \begin{cases} 1 - e^{-\alpha x} & \text{for } x > 0 \\ 0 & \text{for } x \leq 0, \end{cases}$  where  $\alpha$  is the parameter, then find  $P(1 \leq X \leq 2)$ .
2. Every week the average number of wrong-number phone calls received by a certain mail order house is seven. What is the probability that they will receive two wrong calls tomorrow?
3. If there is no linear correlation between two random variables  $X$  and  $Y$ , then what can you say about the regression lines?
4. Let the joint pdf of the random variable  $(X, Y)$  be given by  $f(x, y) = 4xye^{-(x^2+y^2)}$ ;  $x > 0$  and  $y > 0$ . Are  $X$  and  $Y$  independent? Why or why not?
5. Examine whether the Poisson process  $\{x(t)\}$  is stationary or not.
6. When is a Markov chain, called homogeneous?
7. Arrivals at a telephone booth are considered to be Poisson with an average time of 12 mins between one arrival and the next. The length of a phone call is assumed to be distributed exponentially with mean 4 mins. Find the average number of persons waiting in the system.
8. Draw the state transition rate diagram of an M/M/c queueing model.
9. What do you mean by bottleneck of a network?
10. Consider a service facility with two sequential stations with respective service rates of 3/min and 4/min. The arrival rate is 2/min. What is the average service time of the system, if the system could be approximated by a two stage Tandem queue?

PART B — (5 × 16 = 80 Marks)

11. (a) (i) The distribution function of a random variable  $X$  is given by  $F(X) = 1 - (1+x)e^{-x}$ ;  $x \geq 0$ . Find the density function, mean and variance of  $X$ . (8)
- (ii) A coin is tossed until the first head occurs. Assuming that the tosses are independent and the probability of a head occurring is ' $p$ '. Find the value of ' $p$ ' so that the probability that an odd number of tosses required is equal to 0.6. Can you find a value of ' $p$ ' so that the probability is 0.5 that an odd number of tosses are required? (8)

Or

- (b) (i) If  $X$  is a random variable with a continuous distribution function  $F(X)$ , prove that  $Y = F(X)$  has a uniform distribution in  $(0,1)$ .  
Further if  $f(X) = \begin{cases} \frac{1}{2}(x-1); & 1 \leq x \leq 3 \\ 0; & \text{otherwise} \end{cases}$ , find the range of  $Y$  corresponding to the range  $1.1 \leq x \leq 2.9$ . (8)
- (ii) The time (in hours) required to repair a machine is exponentially distributed with parameter  $\lambda = \frac{1}{2}$ .

What is the probability that the repair time exceeds  $2h$ ? What is the conditional probability that a repair takes at least  $10h$  given that its duration exceeds  $9h$ ? (8)

12. (a) (i) Given  $f(x, y) = cx(x-y)$ ,  $0 < x < 2$ ,  $-x < y < x$  and '0' elsewhere. Evaluate 'c' and find  $f_X(x)$  and  $f_Y(y)$ . (8)
- (ii) Compute the coefficient of correlation between  $X$  and  $Y$  using the following data: (8)

$X$ :	1	3	5	7	8	10
$Y$ :	8	12	15	17	18	20

Or

- (b) (i) For two random variables  $X$  and  $Y$  with the same mean, the two regression equations are  $y = ax + b$  and  $x = cy + d$ . Find the common mean, ratio of the standard deviations and also show that  $\frac{b}{d} = \frac{1-a}{1-c}$ . (8)
- (ii) If  $X_1, X_2, \dots, X_n$  are Poisson variates with parameter  $\lambda = 2$ , use the central limit theorem to estimate  $P(120 \leq S_n \leq 160)$ , where  $S_n = X_1 + X_2 + \dots + X_n$  and  $n = 75$ . (8)
13. (a) (i) If customers arrive at a counter in accordance with a Poisson process with a mean rate of 2/min, find the probability that the interval between 2 consecutive arrivals is more than 1 min, between 1 and 2 mins, and 4 mins or less. (8)
- (ii) An engineer analyzing a series of digital signals generated by a testing system observes that only 1 out of 15 highly distorted signals follow a highly distorted signal, with no recognizable signal between, whereas 20 out of 23 recognizable signals follow recognizable signals, with no highly distorted signal between. Given

that only highly distorted signals are not recognizable, find the fraction of signals that are highly distorted. (8)

Or

- (b) (i) Suppose that a mouse is moving inside the maze shown in the adjacent figure from one cell to another, in search of food. When at a cell, the mouse will move to one of the adjoining cells randomly. For  $n \geq 0$ ,  $X_n$  be the cell number the mouse will visit after having changed cells 'n' times. Is  $\{X_n; n = 0, 1, \dots\}$  a Markov chain? If so, write its state space and transition probability matrix. (8)

1	4	7
2	5	8
3	6	9

- (ii) The following is the transition probability matrix of a Markov chain with state space  $\{0, 1, 2, 3, 4\}$ . Specify the classes, and determine which classes are transient and which are recurrent. Give reasons. (8)

$$P = \begin{pmatrix} 2/5 & 0 & 0 & 3/5 & 0 \\ 1/3 & 1/3 & 0 & 1/3 & 0 \\ 0 & 0 & 1/2 & 0 & 1/2 \\ 1/4 & 0 & 0 & 3/4 & 0 \\ 0 & 0 & 1/3 & 0 & 2/3 \end{pmatrix}$$

14. (a) If people arrive to purchase cinema tickets at the average rate of 6 per minute, it takes an average of 7.5 seconds to purchase a ticket. If a person arrives 2 min before the picture starts and it takes exactly 1.5 min to reach the correct seat after purchasing the ticket,
- Can he expect to be seated for the start of the picture?
  - What is the probability that he will be seated for the start of the picture?
  - How early must he arrive in order to be 99% sure of being seated for the start of the picture? (16)

Or

- (b) There are 3 typists in an office. Each typist can type an average of 6 letters per hour. If letters arrive for being typed at the rate of 15 letters per hour,
- What fraction of the time all the typists will be busy?
  - What is the average number of letters waiting to be typed?
  - What is the average time a letter has to spend for waiting and for being typed?
15. (a) Derive Pollaczek-Khinchin formula of M/G/1 queue. (16)

Or

- (b) Write short notes on the following :
- Queue networks (4)
  - Series queues (4)
  - Open networks (4)
  - Closed networks. (4)

Reg. No. :

**Question Paper Code :**

B.E./B.Tech. DEGREE EXAMINATION, NOVEMBER/DECEMBER 2011.

Fourth Semester

Computer Science and Engineering

MA 2262 — PROBABILITY AND QUEUEING THEORY

(Common to Information Technology)

(Regulation 2008)

Time : Three hours

Maximum : 100 marks

(Normal tables be permitted in the examination hall)

Answer ALL questions.

PART A — (10 × 2 = 20 marks)

1. A continuous random variable  $X$  that can assume any value between  $x = 2$  and  $x = 5$  has a density function given by  $f(x) = k(1+x)$ . Find  $P(X < 4)$ .
2. Give the probability law of Poisson distribution and also its mean and variance.
3. The joint pdf of the RV  $(X, Y)$  is given by  $f(x, y) = Kxy e^{-(x^2+y^2)}$ ,  $x > 0, y > 0$ . Find the value of  $K$ .
4. Given the RV  $X$  with density function  $f(x) = \begin{cases} 2x, & 0 < x < 1 \\ 0, & \text{elsewhere.} \end{cases}$  Find the pdf of  $Y = 8X^3$ .
5. Define transition probability matrix.
6. Define markov process.
7. Draw the state transition diagram for  $M/M/1$  queueing model.
8. What do the letters in the symbolic representation  $(a/b/c):(d/e)$  of a queueing model represent?

9. Write the Pollaczek-Khintchine formula.
10. Define series queues.

PART B — (5 × 16 = 80 marks)

11. (a) (i) The DF of a continuous random variable  $X$  is given by

$$\begin{aligned}
 F(x) &= 0, x < 0 \\
 &= x^2, 0 \leq x < \frac{1}{2} \\
 &= 1 - \frac{3}{25}(3 - x^2), \frac{1}{2} \leq x < 3 \\
 &= 1 \quad ; x \geq 3.
 \end{aligned}$$

Find the pdf of  $X$  and evaluate  $P(|X| \leq 1)$  and  $P(\frac{1}{3} < X < 4)$  using both the pdf and PDF.

- (ii) A random variable  $X$  has the following probability distribution

$x:$	-2	-	0	1	2	3
		1				
$p(x)$	0.	$k$	0.	2	0.	3
$:$	1		2	$k$	3	$k$

(1) Find  $k$ , (2) Evaluate  $P(X < 2)$  and  $P(-2 < X < 2)$ , (3) Find the PDF of  $X$  and (4) Evaluate the mean of  $X$ .

Or

- (b) (i) The probability function of an infinite discrete distribution is given by  $P(X = j) = \frac{1}{2^j}$ ;  $j = 1, 2, \dots, \infty$ . Verify that the total probability is 1 and find the mean and variance of the distribution. Find also  $P(X \text{ is even})$ ,  $P(X \geq 5)$  and  $P(X \text{ is divisible by } 3)$ .
- (ii) Define Gamma distribution and find its mean and variance.
12. (a) (i) The joint probability mass function of  $(X, Y)$  is given by  $P(x, y) = K(2x + 3y)$ ,  $x = 0, 1, 2$ ;  $y = 1, 2, 3$ . Find all the marginal and conditional probability distributions.
- (ii) State and prove central limit theorem.

Or

- (b) (i) If  $X$  and  $Y$  are independent RVs with pdf's  $e^{-x}$ ,  $x \geq 0$ , and  $e^{-y}$ ,  $y \geq 0$ , respectively, find the density functions of  $U = \frac{X}{X+Y}$  and  $V = X+Y$ . Are  $U$  and  $V$  independent?
- (ii) Find the correlation coefficient for the following data :
- |     |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|
| $X$ | 1 | 1 | 1 | 2 | 2 | 3 |
|-----|---|---|---|---|---|---|

:	0	4	8	2	6	0
Y	1	1	2	6	3	3
:	8	2	4		0	6

13. (a) (i) Define Poisson process and derive the Poisson probability law.
- (ii) A man either drives a car (or) catches a train to go to office each day. He never goes two days in a row by train but if he drives one day, then the next day he is just as likely to drive again as he is to travel by train. Now suppose that on the first day of the week, the man tossed a fair die and drove to work if and only if a 6 appeared. Find (1) the probability that he takes a train on the third day and (2) the probability that he drives to work in the long run.

Or

- (b) (i) Show that the random process  $X(t) = A \cos(\omega_0 t + \theta)$  is wide-sense stationary, if  $A$  and  $\omega_0$  are constants and  $\theta$  is a uniformly distributed  $RV$  in  $(0, 2\pi)$ .
- (ii) If customers arrive at a counter in accordance with a Poisson process with a mean rate of 2 per minute, find the probability that the interval between 2 consecutive arrivals is (1) more than 1 min. (2) between 1 min and 2 min and (3) 4 min (or) less.
14. (a) Find the mean number of customers in the queue, system, average waiting time in the queue and system of  $M/M/1$  queueing model.

Or

- (b) There are three typists in an office. Each typist can type an average of 6 letters per hour. If letters arrive for being typed at the rate of 15 letters per hour,
- (i) What fraction of the time all the typists will be busy?
- (ii) What is the average number of letters waiting to be typed?
- (iii) What is the average time a letter has to spend for waiting and for being typed?
- (iv) What is the probability that a letter will take longer than 20 min. waiting to be typed and being typed?

15. (a) Discuss  $M/G/1$  queueing model and derive Pollaczek-Khinchine formula.

Or

- (b) Discuss open and closed networks.
